CA Product References

This document references the following CA products:

- CA SiteMinder®
- CA SOA Security Manager
- CA Identity Manager
- CA Security Compliance Manager

Contact CA

Contact Technical Support

For your convenience, CA provides one site where you can access the information you need for your Home Office, Small Business, and Enterprise CA products. At [http://ca.com/support](http://ca.com/support), you can access the following:

- Online and telephone contact information for technical assistance and customer services
- Information about user communities and forums
- Product and documentation downloads
- CA Support policies and guidelines
- Other helpful resources appropriate for your product

Provide Feedback

If you have comments or questions about CA product documentation, you can send a message to techpubs@ca.com.

If you would like to provide feedback about CA product documentation, complete our short customer survey, which is also available on the CA Support website, found at [http://ca.com/docs](http://ca.com/docs).

Chapter 1: Policy Server Management

This section contains the following topics:

Policy Server Management Overview (see page 13)
Policy Server Management Tasks (see page 17)

Policy Server Management Overview

The Policy Server provides a platform for access control that operates in conjunction with other CA products, including:

- CA SiteMinder—Combines the Policy Server with Web Agents to provide access control for Web servers.
- CA SOA Security Manager—Provides access control for XML-based transactions. If you have purchased this product, see the CA SOA Security Manager Policy Configuration Guide for more information.
- CA Identity Manager—Provides identity management services, see the CA Identity Manager Administration Guide for more information.

Note: For information about SiteMinder and policy-based resource management, see the Policy Server Configuration Guide.

Policy Server Components

A Policy Server environment consists of two core components:

- **Policy Server**—Provides policy management, authentication, authorization, and accounting services.
- **Policy Store**—Contains all Policy Server data.

Additional components are included with various CA products, for example, SiteMinder Agents. SiteMinder Agents are integrated with a standard Web server or application server. They enable SiteMinder to manage access to Web applications and content according to predefined security policies. Other types of SiteMinder Agents allow SiteMinder to control access to non-Web entities. For example, a SiteMinder RADIUS Agent manages access to RADIUS devices, while a SiteMinder Affiliate Agent manages information passed to an affiliate’s Web site from a portal site.
policy server operations

the policy server provide access control and single sign-on. it typically runs on a separate windows or unix system, and performs the following key security operations:

- **authentication**—the policy server supports a range of authentication methods. it can authenticate users based on user names and passwords, using tokens, using forms based authentication, and through public-key certificates.

- **authorization**—the policy server is responsible for managing and enforcing access control rules established by policy server administrators. these rules define the operations that are allowed for each protected resource.

- **administration**—the policy server can be configured using the administrative ui. the administration service of the policy server is what enables the ui to record configuration information in the policy store. the policy store is the database that contains entitlement information.

- **accounting**—the policy server generates log files that contain auditing information about the events that occur within the system. these logs can be printed in the form of predefined reports, so that security events or anomalies can be analyzed.

- **health monitoring**—policy server provides health monitoring components.
The following diagram illustrates a simple implementation of a Policy Server in a SiteMinder environment that includes a single SiteMinder Web Agent.

In a Web implementation, a user requests a resource through a browser. That request is received by the Web Server and intercepted by the SiteMinder Web Agent. The Web Agent determines whether or not the resource is protected, and if so, gathers the user’s credentials and passes them to the Policy Server. The Policy Server authenticates the user against native user directories, then verifies if the authenticated user is authorized for the requested resource based on rules and policies contained in the Policy Store. When a user is authenticated and authorized, the Policy Server grants access to protected resources and delivers privilege and entitlement information.

**Note:** Custom Agents can be created using the SiteMinder Agent API. For more information, see the Programming Guide for C.
Policy Server Administration

The following diagram illustrates the Policy Server administrative model:

1. **Policy Server**—The Policy Server provides policy management, authentication, authorization, and accounting services.
2. **Policy store** - The policy store contains all of the Policy Server data. You can configure a policy store in a supported LDAP or relational database.
3. **Administrative UI**—You use the Administrative UI to manage SiteMinder administrator accounts, objects, and policy data through the Policy Server. You configure a directory XML file, an administrator user store, and an object store when installing the Administrative UI:
   - **Object store**—The Administrative UI is an asynchronous application that is event and task-based. The object store stores this information. You configure an object store in either a Microsoft SQL Server or Oracle database.
   - **Administrator user store**—The Administrative UI authenticates SiteMinder administrator accounts using the administrator user store. All of your administrator accounts must be stored in a single administrator user store. You configure an administrator user store in a supported LDAP directory server or ODBC database when installing the Administrative UI.
4. **Report server and databases**—You can create and manage a collection of SiteMinder policy analysis and audit reports from the Administrative UI. A report server and report database are required to use the reporting feature. The report server and report database are required to run policy analysis reports. The report server and audit database are required to run audit-based reports.

## Policy Server Management Tasks

As a Policy Server administrator, you are responsible for system-level configuration and tuning of the SiteMinder environment, monitoring and ensuring its performance, as well as management of users and user sessions as necessary.

You perform most fundamental system configuration and management tasks using the Policy Server Management Console. Others tasks are performed using the Administrative UI.

Policy Server management tasks include:

- Starting and Stopping the Policy Server
- Configuring the Policy Server Executives
- Cache Management
- Configuring and Managing Encryption Keys
- User Session and Account Management
- Monitoring the Health of Your SiteMinder Environment
- Running Reporting

## Policy Server Management Console

The Policy Server Management Console (or Management Console) provides a range of Policy Server configuration and system management options. The Management Console has a tab-based user interface in which information and controls are grouped together by function and presented together on tabs in a single window.

**Important!** The Policy Server Management Console should only be run by users who are members of the administrator group in Microsoft Windows.
Start the Management Console

To open the Management Console

- **Windows**—Select the Policy Server Management Console icon in the SiteMinder program group.
- **UNIX**—Run `installation_directory/siteminder/bin/smconsole`.

**Note:** To run the Policy Server Management Console on UNIX, the X display server needs to be running and the display enabled by `export DISPLAY=n.n.n.n:0.0`, where n.n.n.n is the IP address of the machine running the Policy Server.

Save Changes to Management Console Settings

On any tab in the Management Console, click:

- **Apply** to save the settings and keep the Management Console open.
- **OK** to save the settings and close the Management Console.

**Note:** You must stop and restart the Authentication and Authorization processes to put Management Console settings changes into effect. The Policy Server cannot use the new settings until these services restart.

Policy Server User Interface

The browser-based CA SiteMinder Administrative UI primarily enables management of Policy Server objects, but also provides some system management functionality.

To access the Administrative UI

1. Do one of the following:
   - From the computer hosting the Administrative UI, click Start, Programs, CA, SiteMinder, SiteMinder Administrative UI.
   - Open the following URL in your browser:
     
     `http://host_name.domain/port_number/iam/siteminder`

     The `host_name` is the name of the computer on which the Administrative UI runs. You must use a fully-qualified domain name. If the Administrative UI is not using the default HTTP port (80), you must add the port number as shown in the following example:
     
     `http://maincomputer.example.com:8080/iam/siteminder`

     The login page for the Administrative UI appears.
2. Enter a valid user name and password in the appropriate fields.
   
   If you are accessing the Policy Server for the first time, use the default super user administrator account, which you created during Policy Server installation.

3. Click Log In.

   The Administrative UI opens.

   The contents of the window depend on the privileges of the administrator account you used to login. You will only see the items to which your account has access.
Grant Access to XPS Tools

Access to the XPS Tools included with SiteMinder must be granted to individual users by an Administrator using the Administrative UI.

To grant access to the XPS tools
1. Log into the Administrative UI.
2. Click the Administration tab.
3. Click Administrator, and then click one of the following:
   - To add a new administrator, click Create Administrator
   - To change the access of an existing administrator, click Modify Administrator
4. Enter a name and an optional description in the respective fields.
5. Enter a user path, or click the Lookup button and select an existing user path.
6. (Optional) Select the Super User check box to grant super user rights.
7. Select any of the following check boxes in the command line tools section of the Access Methods group box:
   - **XPSEvaluate Allowed**  
     Grants access to the XPS expression evaluation tool.
   - **XPSEnterprise Allowed**  
     Grants access to the tool that edits the XPS database.
   - **XPSRegClient Allowed**  
     Grants access to the XPS tool that registers Web Access Managers or Reports servers as privileged clients.
   - **XPSCfgClient Allowed**  
     Grants access to the tool that examines configures XPS settings in XPS-aware products.
   - **XPSSecurity Allowed**  
     Grants access to the security tool which creates XPS users and specifies their XPS-related privileges.
8. (Optional) Select the check box of any other access you want to grant.
9. (Optional) To restrict the user’s access to specific categories only, click the Create button, and then select the categories you want.

10. Click Submit.

   Your changes are submitted and a response appears.

More information:

Add Event Handler Libraries (see page 90)
Open the FSS Administrative UI

The FSS Administrative UI is an applet-based application that is installed with the Policy Server. This UI contains federation-specific objects such as affiliates (consumers, service providers, resource partners) and SAML authentication schemes that you configure to support federated communication between two partners.

Important! You must register each UI with the Policy Server. Registering the FSS Administrative UI with the Policy Server ensures that the communication between both components is FIPS-encrypted (AES encryption). For more information about registering a UI, see the Policy Server Installation Guide.

To open the FSS Administrative UI

1. Do one of the following tasks:
   - Open the following URL in your browser:
     http://policy_server_fully_qualified_URL:non_default_port_number/siteminder
     Note: A port number is required only when you are not using the default port.
   - Click Start, Program Files, SiteMinder, SiteMinder FSS Administrative UI. The FSS Administrative UI appears in your browser.

2. Enter the following information:
   - SiteMinder in the Username field
   - The password for the SiteMinder Super User account in the Password field.
   - The name of the 4.x Agent identity you created in the Host Name field.
   - The shared secret of the 4.x Agent identity you created in the Passphrase field.

3. Click Login.

You can administer your SiteMinder federation objects and policies using the FSS Administrative UI.

The intent of the FSS Administrative UI is to let you manage SiteMinder eTrust SiteMinder FSS. If you are familiar with previous versions of the SiteMinder Policy Server User Interface, you will notice that all SiteMinder objects appear in the FSS Administrative UI. The only objects that do not appear are objects related to Enterprise Policy Management (EPM) and reports. You can use the FSS Administrative UI to manage the SiteMinder objects. If you need information while using the FSS Administrative UI, consult the FSS Administrative UI online help system.
Chapter 2: Starting and Stopping the Policy Server

This section contains the following topics:

- Services and Processes Overview (see page 23)
- Start and Stop Policy Server Services on Windows Systems (see page 24)
- Start and Stop Policy Server Processes on UNIX Systems (see page 24)
- Configure the Policy Server Executives (see page 25)

Services and Processes Overview

The Policy Server runs two services under Windows and two processes on UNIX. The Policy Server installation process starts the Policy Server and Monitor processes and configures executive applications to run the processes automatically at system startup in the future.

The main Policy Server processes for Windows are:

**Policy Server**
- Serves Agent requests for authentication, authorization, accounting and logging, and (if enabled) administration.

**SiteMinder Health Monitor Service**
- The OneView Monitor, which monitors the health and performance of the authentication server, authorization server, and Web Agent.

The main Policy Server processes for UNIX are:

**smpolicysrv**
- Serves Agent requests for authentication, authorization, accounting and logging, and (if enabled) administration.

**smmon**
- The OneView Monitor, which monitors the health and performance of the authentication server, authorization server, and Web Agent.
Start and Stop Policy Server Services on Windows Systems

To start or stop Policy Server services on Windows systems:

- On the Management Console Status tab, click the Start or Stop button.
- Use the Windows Services dialog, which you can access from the Windows Start Menu using Settings, Control Panel, Services. When you start or stop a Policy Server process, the associated executive starts or stops.
- You can stop the policy server from the command line using smpolicysrv:

  ```
  installation_path\siteminder\bin\smpolicysrv -stop
  ```

**Note:** On Windows systems, do not run the smpolicysrv command from a remote desktop or Terminal Services window. The smpolicysrv command depends on inter-process communications that do not work if you run the smpolicysrv process from a remote desktop or Terminal Services window.

**Important!** If you are running a SiteMinder utility or executable on Windows Server 2008, be sure to open the command-line window with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

Start and Stop Policy Server Processes on UNIX Systems

To start or stop Policy Server processes on UNIX systems, take either of these actions:

- On the Management Console Status tab, click the corresponding Start and Stop button.
- Use the supplied scripts. Two scripts are provided to start and stop the Policy Server processes. These scripts also stop the UNIX executive so that the processes do not restart automatically.

  ```
  installation_path/siteminder/start-all
  installation_path/siteminder/stop-all
  ```

In addition, the following script can be used to start and stop the Policy Server process. If the UNIX executive is not running when you execute the script, the executive starts along with the process. The script can be invoked with the same command line options, as follows:

  ```
  installation_path/siteminder/smpolsrv
  ```
Configure the Policy Server Executives

Command line options:

- **stop**
  - Stops a process.

- **start**
  - Starts a process.

- **status**
  - Indicates whether or not a process is running.

The Policy Server logs all UNIX executive activity in the `installation_directory/log/smexec.log` file. Log entries are always appended to the existing log file.

More Information:

Command Line Troubleshooting of the Policy Server (see page 219)

Configure the Policy Server Executives

In both UNIX and Windows installations of the Policy Server, one or more executive applications monitor the status of Policy Server processes and automatically restart any processes that fail. The following sections describe how to start and stop Policy Server processes based on your platform and how to configure, disable, and enable the UNIX and Windows executives.
Configure Windows Executives

For Windows, each Policy Server process is monitored by a separate executive. Each of these executives reads the following threshold values from the `Policy_Server_installation_path\config\siteminder.conf` configuration file:

**SMEXEC_UPTIME_THRESHOLD**

Indicates the minimum amount of time (in seconds) a Policy Server service must run after startup before the associated executive stops monitoring for frequent crashes. The default value for this parameter is 60 seconds.

**SMEXEC_RESTART_THRESHOLD**

Indicates the maximum number of times the executive attempts to restart a service in the time specified by the `SMEXEC_UPTIME_THRESHOLD` parameter. If a service crashes more than the number of attempts specified by this parameter, the executive stops attempting to restart the service. The default value for this parameter is five attempts.

To change the threshold parameters, edit the `siteminder.conf` file and restart the Policy Server processes.

Configure the UNIX Executive

For UNIX, the Policy Server and Health Monitor processes are monitored by a single executive. The executive reads its settings from the following configuration file:

`installation_path/config/siteminder.conf`

You can edit this file to change the following settings:

**POLICYSERVER_ENABLED**

Indicates the state of the Policy Server process when the executive starts running. Set this parameter to YES to enable the process at executive startup.

**MONITOR_ENABLED**

Indicates the state of the health monitor process when the executive starts running. Set this parameter to YES to enable the process at executive startup.

**SMEXEC_UPTIME_THRESHOLD**

Indicates the minimum amount of time (in seconds) a Policy Server service must run after startup before the associated executive stops monitoring for frequent crashes. The default value for this parameter is 60.
SMEXEC_RESTART_THRESHOLD

Indicates the maximum number of times the executive attempts to restart a service in the time specified by the SMEXEC_UPTIME_THRESHOLD parameter. If a service crashes more than the number of attempts specified by this parameter, the executive stops attempting to restart the service. The default value for this parameter is five attempts.

To change any of the UNIX Executive parameters

1. Edit the installation_path/config/siteminder.conf file.
2. From a command line, run the following script:
   
   ```bash
   installation_path/siteminder/bin/stop-all
   
   The Policy Server processes stop.
   
   3. From a command line, run the following script:
      
      ```bash
      installation_path/siteminder/bin/start-all
      
      The UNIX executive restarts using the new settings in the siteminder.conf file.
Chapter 3: Configuring Policy Server Data Storage Options

This section contains the following topics:

Configure Data Storage Options Overview (see page 29)
Configure the Policy Store Database (see page 30)
Configure the Key Store or Audit Logs to Use the Policy Store Database (see page 31)
Configure a Separate Database for the Key Store (see page 31)
Configure a Separate Database for the Audit Logs (see page 32)
Configure a Separate Database for Token Data (see page 32)
Configure a Database for the Session Server (see page 33)
Configure LDAP Storage Options (see page 34)
Configure ODBC Storage Options (see page 37)
Configure Text File Storage Options (see page 38)
Audit Data Import Tool for ODBC (see page 38)
Specify a Netscape Certificate Database File (see page 42)

Configure Data Storage Options Overview

You configure storage locations for Policy Server databases (policy store, key store, and audit logs) from the Management Console Data tab.

To configure Policy Server data storage settings
1. Start the Policy Server Management Console.

   Important! If you are accessing this graphical user interface on Windows Server 2008, open the shortcut with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

2. Click the Data tab.

3. Select the database that you want to configure from the Database drop-down list. The database you select determines the storage possibilities that are available for that database type and presented on the Storage drop-down list.

   Note: The table at the end of this procedure lists the databases you can configure and the storage options available for each one. The combination of these settings determines the settings displayed in the context-sensitive group box below them.

4. Select a storage type for the selected database from the Storage drop-down list.
5. Configure data storage options for the chosen Policy Server database in the context-sensitive group box below the Database and Storage controls.

6. When you have finished, click Apply to save your settings, or click OK to save the settings and exit the Management Console.

The following table lists SiteMinder database types and the available storage options:

<table>
<thead>
<tr>
<th>Database</th>
<th>Database Description</th>
<th>Available Storage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy Store</td>
<td>The database for the Policy Store. You <em>must</em> specify the Policy Store database.</td>
<td>LDAP, ODBC</td>
</tr>
<tr>
<td>Key Store</td>
<td>The database that contains keys used to encrypt cookies created by SiteMinder Agents.</td>
<td>LDAP, ODBC</td>
</tr>
<tr>
<td>Audit Logs</td>
<td>The database where you store audit logs containing event information.</td>
<td>ODBC, Text file</td>
</tr>
<tr>
<td>Session Server</td>
<td>The database in which the session server stores persistent session data.</td>
<td>ODBC</td>
</tr>
</tbody>
</table>

**Configure the Policy Store Database**

The Policy Store is the database in which all Policy Server objects are stored.

**To configure the policy store database**

1. Select Policy Store from the Database drop-down list.
2. Select an available storage type (LDAP or ODBC) from the Storage drop-down list.
3. Specify Storage Options appropriate for the chosen storage type.
4. Click Apply to save your settings, or click OK to save the settings and exit the Console.
5. (Optional) If you changed the Policy Store database storage type to LDAP, and want the Policy Store to be used as the key store, complete the steps described [Configure the Key Store or Audit Logs to Use the Policy Store Database](#) (see page 31).

**Note:** If you have one or more Policy Servers communicating with an LDAP-enabled policy store, configure the same setting in the Management Console on each of those Policy Server systems.
Configure the Key Store or Audit Logs to Use the Policy Store Database

After you configure the Policy Store, you can optionally configure databases. If the Policy Store is of a compatible storage type (that is, if the Policy Store is configured to be stored in a database that is also a valid storage option for the other database), you can configure the Policy Server to use the policy store database as one or more of the following:

- Key store
- Audit logs

**Important!** If you are using an LDAP database as your Policy Store, do not use the Policy Store database for audit logs. Audit logs cannot be written to an LDAP database. If you are using the SiteMinder sample data source (SmSampleUsers) as your Policy Store, do not use the Policy Store database for audit logs. Audit logs are not supported by the sample policy store.

To configure another database to be stored in the Policy Store database, set the Use Policy Store Database option that appears between the Database drop-down list and the Storage Options area whenever a database other than Policy Store is chosen from the Database drop-down list.

When the Use Policy Store Database option is selected, the Storage drop-down list and the context-sensitive Storage Options are grayed-out.

Configure a Separate Database for the Key Store

The Key store is where the Policy Server stores keys used to encrypt cookies created by SiteMinder Agents.

**To configure a separate database for the key store**

1. Choose Key Store from the Database drop-down list.
2. Choose an available storage type (LDAP or ODBC) from the Storage drop-down list.

   **Note:** The Policy Server supports mixed LDAP/ODBC policy and key stores. The policy store can exist in an ODBC database and the key store can reside in an LDAP Directory Server or vice versa. For a list of supported databases, refer to the SiteMinder Platform Matrix on the Technical Support site.
Configure a Separate Database for the Audit Logs

3. Specify Storage Options appropriate for the chosen storage type.
4. Click Apply to save your settings, or click OK to save the settings and exit the Console.

More information:

Configure LDAP Storage Options (see page 34)

Configure a Separate Database for the Audit Logs

The audit log database is where the Policy Server stores audit logs containing event information. These settings may reduce Policy Server performance. If this is a problem, configure auditing data logs in a text file instead of database.

To configure a separate database for audit logs
1. Choose Audit Log from the Database drop-down list.
2. Choose an available storage type (ODBC or Text file) from the Storage drop-down list.
3. Specify Storage Options appropriate for the chosen storage type.
4. Click Apply to save your settings, or click OK to save the settings and exit the Console.

When deciding whether to store the Policy Server audit logs in an ODBC database or text file, you should consider the following factors:

- SiteMinder Reporting requires that the audit logs are written to an ODBC database. Reporting will not function if the audit logs are written to a text file.
- SiteMinder audit logging to an ODBC database and to a text file supports internationalization (I18N).
- If your Policy Server will operate under heavy load, you should consider logging to a text file rather than an ODBC database. However, if you do log to an ODBC database, you should set the following registry key values in the HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\Database\registry location to prevent loss of auditing data under heavy load:
  
  **ConnectionHangwaitTime**
  
  Set to 60 seconds for heavy loads. The default is 30 seconds.

  **QueryTimeout**
  
  Set to 30 seconds for heavy loads. The default is 15 seconds.
Configure a Separate Database for Token Data

The token data database is where the Policy Server stores token data for hardware authentication tokens.

To configure a separate database for token data
1. Choose Token Data from the Database drop-down list.
2. Choose an available storage type (ODBC) from the Storage drop-down list.
3. Specify the ODBC Storage Options appropriate for the chosen storage type.
4. Click Apply to save your settings, or click OK to save the settings and exit the Console.

Configure a Database for the Session Server

The session server database is where the Policy Server Session Server stores persistent session data.

To configure a database for the session server
1. Choose Session Server from the Database drop-down list.
2. Choose an available storage type from the Storage drop-down list.
3. Set the Enable Session Server option.
   - You should only enable the Session Server if you are going to use persistent sessions in one or more realms; when enabled, the Session Server impacts Policy Server performance.
   - Note: The Use Policy Store database check box is disabled. For performance reasons, the session server cannot be run on the same database as the policy store.
4. Specify Storage Options appropriate for the chosen storage type.
5. Click OK to save the settings and exit the Console.

LoginTimeout
Set to 30 seconds for heavy loads. The default is 15 seconds.

Note: The value of ConnectionHangwaitTime should always be at least double the value of QueryTimeout and LoginTimeout.
Configure LDAP Storage Options

Configure Session Server Timeout for Heavy Load Conditions

Under extremely heavy load conditions, long-running queries necessary for Session Server maintenance tasks, such as removing idled-out or expired sessions, can timeout. You can adjust the timeout for Session Server maintenance tasks (60 seconds by default), by increasing the value of the MaintenanceQueryTimeout registry setting to allow the maintenance thread to complete its' tasks successfully. The MaintenanceQueryTimeout registry setting can be found at the following registry location:

\HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\SessionServer

Configure LDAP Storage Options

Use the LDAP context-sensitive storage controls to point to an LDAP directory configured to be used as a policy store to hold policy information or to point to an LDAP directory configured to be used as a key store.

**Note:** Whenever you update parameters relating to an LDAP database, restart the Policy Server to make the new parameters effective.

Configure an LDAP Database

**To configure an LDAP database**

1. Specify the Server name or IP address of the LDAP server in the LDAP IP Address field. For performance reasons, the IP address is preferred.
   **Note:** You can specify multiple servers in this field to allow for LDAP server failover.

2. Specify the LDAP branch under which the SiteMinder schema is located in the Root DN field (for example, o=myorg.org).

3. If your Policy Server communicates with the LDAP directory over SSL, select the Use SSL check box.
   **Note:** If you select this option, you must specify a certificate database in the Netscape Certificate Database File field.

4. Specify the DN of the LDAP directory administrator (for example, cn=Directory Manager) in the Admin Username field.

5. Enter the administrative password for the LDAP directory in the Admin Password field.
6. Confirm the administrative password for the LDAP directory in the Confirm Password field.

7. Click Test LDAP Connection to verify that the parameters you entered are correct and that the connection can be made.

**Configure LDAP Failover**

If you have multiple LDAP directories, you can configure directories for failover. To enable failover, enter LDAP server IP addresses and port numbers in the LDAP Server field as a space-delimited list of LDAP server addresses. You can specify a unique port for each server. If your LDAP servers are running on a non-standard port (389 for non SSL/ 636 for SSL), append the port number to the last server IP address using a ‘:’ as a delimiter. For example, if your servers are running on ports 511 and 512, you can enter the following:

```
123.123.12.11:511 123.123.12.22:512
```

If the LDAP server 123.123.12.11 on port 511 did not respond to a request, the request is automatically passed to 123.123.12.22 on port 512.

If all of your LDAP servers are running on the same port, you can append the port number to the last server in the sequence. For example, if all of your servers are running on port 511, you can enter the following:

```
123.123.12.11 123.123.12.22:511
```

**Configure Enhanced LDAP Referral Handling**

Enhancements have been made to SiteMinder’s LDAP referral handling to improve performance and redundancy. Previous versions of SiteMinder supported automatic LDAP referral handling through the LDAP SDK layer. When an LDAP referral occurred, the LDAP SDK layer handled the execution of the request on the referred server without any interaction with the Policy Server.

SiteMinder now includes support for non-automatic (enhanced) LDAP referral handling. With non-automatic referral handling, an LDAP referral is returned to the Policy Server rather than the LDAP SDK layer. The referral contains all of the information necessary to process the referral. The Policy Server can detect whether the LDAP directory specified in the referral is operational, and can terminate a request if the appropriate LDAP directory is not functioning. This feature addresses performance issues that arise when an LDAP referral to an offline system causes a constant increase in request latency. Such an increase can cause SiteMinder to become saturated with requests.
To configure LDAP referral handling
1. Open the Policy Server Management Console.
   **Important!** If you are accessing this graphical user interface on Windows Server 2008, open the shortcut with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.
2. Select the Data tab.
   **Enable Enhanced Referrals**
   Mark this check box to allow the Policy Server to use enhanced handling LDAP referrals at the Policy Server, rather than allowing LDAP referral handling by the LDAP SDK layer.
   **Max Referral Hops**
   Indicates the maximum number of consecutive referrals that will be allowed while attempting to resolve the original request. Since a referral can point to a location that requires additional referrals, this limit is helpful when replication is misconfigured, causing referral loops.
3. Modify the values as required.
4. Restart the Policy Server.

Configure Support for Large LDAP Policy Stores

Large LDAP policy stores can cause Administrative UI performance issues.

To prevent these problems, you can modify the values of these two registry settings:

**Max AdmComm Buffer Size**

Specifies the Administrative UI buffer size (specifically, the maximum amount of data, in bytes, that is passed from the Policy Server to the Administrative UI in a single packet).

The Max AdmComm Buffer Size registry setting should be configured at the following registry location:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\PolicyServ\...
```

The value of this setting must be set very carefully as allocation of a larger buffer results in a decrease in overall performance. The acceptable range of Max AdmComm Buffer Size is 256KB to 2 GB. The default value this is 256KB (also applies when this registry setting does not exist).
Configure ODBC Storage Options

**SearchTimeout**

Specifies the search timeout, in seconds, for LDAP policy stores.

The SearchTimeout registry setting should be configured at the following registry location:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\LdapPolicyStore\SearchTimeout
```

The appropriate value for this setting depends upon and can vary according to several factors including network speed, size of the LDAP search query response, the LDAP connection state, load on LDAP server, and so on. The value should be large enough to prevent LDAP timeout when fetching large amounts of policy store data from the LDAP server. The default value is 20 seconds (also applies when this registry setting does not exist).

**More information:**

- [Configure the Policy Store Database](#) (see page 30)
- [Configure a Separate Database for the Key Store](#) (see page 31)

Configure ODBC Storage Options

Use the ODBC context-sensitive storage controls to configure an ODBC data source to hold the policy store, key store, audit logs, token data, or session server data.

**Note:** For more information on installing ODBC data sources, see the *Policy Server Installation Guide*.

Configure an ODBC Data Source

**To configure an ODBC data source**

1. Specify the name of the ODBC data source in the Data Source Information field. You can enter multiple names in this field to enable ODBC failover.

**Data Source Information**

Indicates the name of the ODBC data source. You can enter multiple names in this field to enable failover.

**User Name**

Indicates the user name of the database account (if required) with full rights to access the database.

**Password**

Contains the password of the database account.
Configure Text File Storage Options

**Confirm Password**

Contains a duplicate of the database account password, for verification.

**Maximum Connections**

Indicates the maximum number of ODBC connections per database allowed at one time.

2. Click Test ODBC Connection to verify that the parameters you entered are correct and that the connection can be made.

Configure ODBC Failover

If you have multiple ODBC data sources and you want to configure failover, list the data source names in the Data Source Information field, separated by commas. For example, entering SiteMinder Data Source1,SiteMinder Data Source2 in the Data Source Name field causes the Policy Server to look at Data Source 1 first. If SiteMinder Data Source1 does not respond, the Policy Server automatically looks for SiteMinder Data Source2.

**Note:** Using the method described above, you can configure failover for data sources used as policy stores, key stores, session stores, and audit logs.

Configure Text File Storage Options

Use the Text File storage options to configure a text file to store the Policy Store audit logs.

To specify a text file, type the full path of a file in the File name field or click the Browse button and browse to the required directory and click on or type the name of the desired file.

Audit Data Import Tool for ODBC

The Policy Server can store audit data in an ODBC database or output audit data to a text file. The tool smauditimport reads a SiteMinder audit data text file and imports the data into an ODBC database that has been configured as an audit store using 5.x or 6.x schema.

The smauditimport tool imports authentication, authorization, and admin data into the corresponding tables in the ODBC database. The tool logs the number of rows successfully imported into the ODBC database. For each row in the text file that is successfully imported, the tool replaces the leading character "[" with the number sign ".". For each row that cannot be imported into the ODBC database, the tool logs the row number.
The smauditimport tool can be run multiple times on the same file. The tool only processes those rows that have not been successfully imported into the ODBC database or the rows that begin with the opening bracket "[". To restore a text file to its original format, replace the leading character of every row with the opening bracket "."

**Note:** In some SiteMinder documentation, the terms "audit" and "logging" are used interchangeably.

### Log More Audit Data to a Text File

By default, the Policy Server logs less audit data to a text file than to an ODBC database. You can log more audit data to a text file than the default and bring the amount of data in line with an ODBC database. To do so, manually add the following registry key and set its value to one: "Enable Enhance Tracing". To disable "Enable Enhance Tracing", set its value to zero (the default).

**To log more audit data to a text file**

1. Manually add the registry key "Enable Enhance Tracing":
   - **Windows**
     - Add the following key:
       ```
       HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\Reports
       "Enable Enhance Tracing"
       ```
   - **Solaris**
     - Follow these steps:
       a. Open the file: `.../siteminder/registry/sm.registry`.
       b. Locate the line:
       ```
       "Enable Enhance Tracing"=0x1; REG_DWORD
       ```
       c. Below the line, add the following:
       ```
       "Enable Enhance Tracing"=0x1; REG_DWORD
       ```
       d. Save and close the file.
2. Set "Enable Enhance Tracing" to one.

**Note:** The value of "Enable Enhance Tracing" does not affect logging of Entitlement Management Services (EMS) events.
Audit Data Import Prerequisites for ODBC

Before you run the tool smauditimport, verify that the following prerequisites have been satisfied:

- The Policy Server is installed on a Windows, Solaris, or Linux operating environment.
  
  **Note:** For Solaris and Linux platforms, run nete_ps_env.ksh before running the smauditimport tool.

- The ODBC database is configured as an audit (logging) store with 5.x or 6.x schema.
  
  **Note:** For more information about how to configure an ODBC database as an audit (logging) store, see the Policy Server Installation Guide.

- The registry key “Enable Enhance Tracing” is set to one.

Import Audit Data into an ODBC Database

The tool smauditimport reads a SiteMinder audit data text file and imports it into an ODBC database. The tool is located in the \bin directory under the Policy Server installation directory.

**Important!** Before you import audit data into an ODBC database, configure the database as an audit store with SiteMinder 5.x or 6.x schema. For more information about how to configure an ODBC database with SiteMinder schema, see the Policy Server Installation Guide.

**Important!** If you are running a SiteMinder utility or executable on Windows Server 2008, be sure to open the command-line window with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

**To import audit data into an ODBC database**

1. On the computer where the Policy Server is installed, navigate to siteminder_installation\bin.

   **siteminder_installation**

   Specifies the Policy Server installation path.
2. Run the following command:

   smauditimport audit_file dsn user_name user_password -f -v
   -b bulk_load_size -s5 | -s6

   **audit_file**
   Specifies the path and name of the text file containing the audit data.
   **Note:** The smauditimport tool requires the full path name of the audit data text file.

   **dsn**
   Specifies the Data Source Name (DSN) of the ODBC database.

   **user_name**
   Specifies the name of the ODBC database administrator.

   **user_password**
   Specifies the password of the ODBC database administrator.

   **-f**
   (Optional) When an error occurs while importing audit data, smauditimport logs the row number and continues processing.
   **Default:** Without the -f option, smauditimport logs the row number, but stops processing when an error occurs.

   **-v**
   (Optional) Validates the number of fields in the text file, validates that the values in numeric fields fall within specified ranges, validates the connection to the database, and outputs errors.
   **Note:** When the smauditimport tool is run in the validation mode, no data is imported into the database.

   **-b bulk_load_size**
   (Optional) Specifies the number of rows to read and import into the ODBC database.
   **Default:** 100

   **-s5 | -s6**
   (Optional) Supports an ODBC database configured as an audit store with either 5.x schema or 6.x schema.
   **Default:** Supports an ODBC database configured as an audit store with 6.x schema.
Specify a Netscape Certificate Database File

If you are using an LDAP directory to store policies or user information over SSL, you must point the Policy Server to the directory that contains Netscape Certificate Database files. The directory must contain the cert7.db and key3.db files.

Before you install the Certificate Database file, make a copy of it. Use the certificate database copy instead of the original and do not use cert7.db if it is currently being used by Netscape Communicator.

Type the name of the Certificate database in the Netscape Certificate Database file field or browse the directory tree to locate and select the database. This field does not require a value for Active Directory user stores configured in the Administrative UI using the AD namespace. AD user stores use the native Windows certificate repository when establishing an SSL connection.

More information:

Configure a Separate Database for the Audit Logs (see page 32)
Chapter 4: Configuring General Policy Server Settings

This section contains the following topics:

Policy Server Settings Overview (see page 43)
Configure Policy Server Settings (see page 43)

Policy Server Settings Overview

The Policy Server allows you to configure a number of general settings that determine the way it behaves and performs from the Policy Server Management Console Settings tab:

- TCP ports for access control
- Administration settings including the TCP port, and Inactivity Timeout
- Connection settings
- RADIUS settings
- Performance settings
- OneView Monitor settings

Configure Policy Server Settings

To configure general Policy Server settings

1. Start the Policy Server Management Console.

   Important! If you are accessing this graphical user interface on Windows Server 2008, open the shortcut with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

2. Click the Settings tab.

3. Adjust the desired settings.

4. When you have finished, click Apply to save your settings, or click OK to save the settings and exit the Management Console.
Configure Access Control Settings

The Policy Server uses three separate TCP ports to communicate with SiteMinder Agents for authentication, authorization, and accounting.

To enable or disable these Agent communication ports, as well as change the TCP port numbers used for each function, use the controls in the Access Control group box on the Management Console Settings tab.

Configure Policy Server Administration Settings

The Policy Server uses a TCP port to communicate with the Administrative UI to allow browser-based policy management.

To enable or disable and change the TCP port number used to communicate with the Administrative UI, as well as specifying a timeout value for administrative inactivity, use the controls in the Administration group box on the Management Console Settings tab.

Configure Policy Server Connection Options

To specify the maximum number of Policy Server threads, and the idle timeout for a connection to the Policy Server, use the controls in the Connection Options group box on the Management Console Settings tab.

Configure Policy Server Performance Settings

To configure cache and thread settings to tune Policy Server performance, use the Performance group box on the Management Console Settings tab.

Configure RADIUS Settings

To specify settings to enable support of RADIUS components in your deployment, use the RADIUS group box on the Management Console Settings tab.
Configure OneView Monitor Settings

By default the OneView Monitor runs locally on the Policy Server that it is monitoring.

To configure the monitor to accept connections from other Policy Servers to be monitored remotely or to specify a central remote Policy Server that is to monitor all Policy Servers in a cluster, use the OneView Monitor group box on the Management Console Settings tab.

Reschedule SiteMinder Policy Data Synchronization

SiteMinder automatically synchronizes Policy Data using the XPSSweeper tool. You can change how often this tool runs by setting the following parameter:

**AutosweepSchedule**

Specifies the days and times (hour and minute) at which the XPSSweeper process runs.

**Default:** Mondays at 08:30

**Limits:** GMT Time zone using the 24-hour clock. Separate multiple entries with commas or spaces

**Example:** Mon@13:30, Tue@14:00

**Note:** If you do not have write access to the SiteMinder binary files (XPS.dll, libXPS.so, libXPS.sl), an Administrator must grant you permission to use the related XPS command line tools using the Administrative UI or the XPSSecurity tool.

To reschedule the synchronization of the SiteMinder databases

1. Open a command line on the Policy Server, and enter the following command:
   
   xpsconfig
   
   The tool starts and displays the name of the log file for this session, and a menu of choices opens.

2. Enter the following:
   
   xps
   
   A list of options appears.

3. Enter the following:
   
   8 (AutosweepSchedule)
   
   The current schedule for the XPSSweeper tool appears.
4. Type C, and then enter the day and time you want. If you want to enter several days or times, separate them with commas or spaces. Use the following format:

Mon@13:30,Tue@14:00

The new and old settings appear. The values you added are shown at the bottom of the settings as a "pending value."

5. Do the following:
   a. Enter Q twice.
   b. Enter L.
   c. Enter Q to end your XPS session.

Your changes are saved and the command prompt appears.

More information:

Policy Server Tools Overview (see page 153)
Chapter 5: Changing the Policy Server Super User Password

This section contains the following topics:

Super User Password Overview (see page 47)
Change the Policy Server Super User Password (see page 47)

Super User Password Overview

The Super User is the Policy Server administrator account established automatically by the Policy Server installation process. You can change the Super User password from the Management Console Super User tab.

Note: Changing the Super User Account Password in this dialog box does not enable the Super User if it has been previously disabled by using the Administrative UI.

Change the Policy Server Super User Password

To change the Policy Server super user password

1. Start the Policy Server Management Console.

   Important! If you are accessing this graphical user interface on Windows Server 2008, open the shortcut with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

2. Click the Super User tab.

3. In the Old Password field, enter the current password of the Super User.

4. In the New Password field, enter the new password of the Super User.

   Note: The SiteMinder superuser administrator’s password may not contain the pipe (|), greater than (>) or less than (<) characters.

5. In the Confirm Password field, enter the new password to verify it.

6. Click Apply to save the Super User changes, or click OK to save the settings and close the Console.

   Note: Changes to the Super User account password take effect without restarting the Policy Server process.
Chapter 6: Configuring and Managing Encryption Keys

This section contains the following topics:

- **Policy Server Encryption Keys Overview** (see page 49)
- **Key Management Overview** (see page 50)
- **FIPS 140-2** (see page 51)
- **Agent Keys** (see page 52)
- **Dynamic Agent Key Rollover** (see page 53)
- **Static Keys** (see page 54)
- **Session Ticket Keys** (see page 55)
- **Key Management Scenarios** (see page 55)
- **Reset the r6.x Policy Store Encryption Key** (see page 61)
- **Reset the r12.x Policy Store Encryption Key** (see page 63)
- **Configure Agent Key Generation** (see page 65)
- **Manage Agent Keys** (see page 65)
- **Manage the Session Ticket Key** (see page 68)
- **Shared Secret for a Trusted Host** (see page 71)

Policy Server Encryption Keys Overview

The Policy Server and Agents use encryption keys to encrypt and decrypt sensitive data passed between Policy Servers and Agents in a SiteMinder environment.

- Agent keys are used to encrypt SiteMinder cookies that may be read by all agents in a single sign-on environment, and are shared by all agents in a single sign-on environment, since each agent must be able to decrypt cookies encrypted by the other agents. Agent keys are managed by the Policy Server, and distributed to agents periodically.

- Session ticket keys are used by the Policy Server to encrypt session tickets. Session tickets contain credentials and other information relating to a session (including user credentials). Agents embed session tickets in SiteMinder cookies, but cannot access the contents since they do not have access to session ticket keys which never leave the Policy Server.

Both types of keys are kept in the Policy Server's key store and distributed to Agents at runtime. By default, the key store is part of the Policy Store, but a separate key store database can be created if desired.
Other, special keys are:

- A policy store key is used to encrypt certain data in the policy store. The policy store key is stored, encrypted, in an on-disk file. The Policy Server encrypts the policy store key using a proprietary technique. The policy store key is derived from the encryption key specified when you installed the Policy Server.

- A key store key is used to encrypt agent and session ticket keys in a separately configured key store. The key store key is kept in the registry (or UNIX equivalent) encrypted with the policy store key.

**Key Management Overview**

To keep key information updated across large deployments, the Policy Server provides an automated key rollover mechanism. You can update keys automatically for Policy Server installations that share the same key store. Automating key changes also ensures the integrity of the keys. For SiteMinder Agents that are configured for single sign-on, the key store must be replicated and shared across all SiteMinder environments in the single sign-on environment.

If the Policy Server determines that a key store that was configured separately from the policy store is unavailable, it attempts to reconnect to the key store to determine if it has come back online. If the connection fails, the Policy Server:

- Goes in to a suspended state and refuses any new requests on established connections until the key store comes back online.

  A Policy Server in a suspended state remains up for the length of time specified in SuspendTimeout, at which point the Policy Server shuts down gracefully. If SuspendTimeout is equal to zero, the Policy Server remains in the suspended state until the key store connection is reestablished.

- Returns an error status to let Web Agents failover to another Policy Server.

- Logs the appropriate error messages.

Additionally, when the Policy Server is started and the key store is unavailable, the Policy Server shuts down gracefully.

You manage keys using the SiteMinder Key Management dialog box in the FSS Administrative UI.
FIPS 140-2

The Federal Information Processing Standards (FIPS) 140-2 publication specifies the requirements for using cryptographic algorithms within a security system protecting sensitive, unclassified data. SiteMinder embeds RSA 's Crypto-C ME v2.0 cryptographic library, which has been validated as meeting the FIPS 140-2 Security Requirements for Cryptographic Modules. The validation certificate number for this module is 608.

SiteMinder's Java-based APIs use a FIPS-compliant version of the Crypto-J cryptographic library.

SiteMinder can operate in a pre-FIPS mode or in a FIPS-only mode. The cryptographic boundaries, that is, the way SiteMinder applies encryption, are the same in both modes, but the algorithms are different.

In FIPS-only mode, SiteMinder uses the following algorithms:

- AES Key Wrap for key encryption.
- AES in OFB mode (HMAC-SHA 256) for channel encryption.
- AES in CBC mode (HMAC-SHA 224) for encrypting tokens used to facilitate single sign-on.

The SiteMinder core components make extensive use of encrypted data:

- The Web Agent encrypts:
  - Cookies using an Agent Key retrieved from the Policy Server
  - Data sent to the Policy Server using a Session Key
  - A Shared Secret using the Host Key. The encrypted Shared Secret is stored in the Host Configuration file.

- The Policy Server encrypts:
  - Data sent to the Web Agent using a Session Key
  - The Policy Store Key using the Host Key
  - Sensitive data in the Policy Store using the Policy Store Key
  - Session Spec using the Session Ticket Key
  - Data sent to the Administrative UI using a Session Key
  - Password Services data in a user directory using the Session Ticket Key
The Policy Store Key is used to encrypt sensitive data stored in the Policy Store. It is derived from a seed string entered during the installation of the Policy Store. The Policy Store Key is also encrypted, using the Host Key, and stored in a system-local file. To support unattended operation, the Host Key is a fixed key embedded in the Policy Store code. Agents use this same Host Key mechanism to encrypt and store their copies of their Shared Secrets.

The Session Ticket Key (used by the Policy Server to form authentication tokens) and Agent Keys (primarily used by Web Agents to encrypt cookie data) are encryption keys stored in the Policy Store (or Key Store, depending on SiteMinder configuration settings) in encrypted form. They are encrypted using the Policy/Key Store Key. The Key Store Key is encrypted in the Policy Store. Agent Shared Secrets (used for Agent authentication and in the TLI Handshake), along with other sensitive data, are also encrypted with the Policy Store Key and stored in the Policy Store.

Agent Keys

SiteMinder Web Agents use an Agent key to encrypt cookies before passing the cookies to a user’s browser. When a Web Agent receives a SiteMinder cookie, the Agent key enables the Agent to decrypt the contents of the cookie. Keys must be set to the same value for all Web Agents communicating with a Policy Server.

The Policy Server provides the following types of Agent keys:

- **Dynamic Keys** are generated by a Policy Server algorithm and are distributed to connected Policy Servers and any associated SiteMinder Web Agents. Dynamic keys can be rolled over at a regular interval, or by using the Key Management dialog box of the Administrative UI. For security reasons, this is the recommended type of Agent key.

- **Static Keys** remain the same indefinitely, and can be generated by a Policy Server algorithm or entered manually. SiteMinder deployments uses this type of key for a subset of features that require information to be stored in cookies on a user’s machine over extended periods of time.

  **Note:** A static agent key is always generated at installation. This static key is used for certain other product features, such as user management, whether or not you use the static key as the Agent key.

**More information:**

[Dynamic Agent Key Rollover](see page 53)
Dynamic Agent Key Rollover

Dynamic Agent key rollover is configured in the Key Management dialog of the FSS Administrative UI. Web Agents poll the Policy Server for key updates at a regular interval. If keys have been updated, Web Agents pick up the changes during polling. The default polling time is 30 seconds, but can be configured by changing the pspollinterval parameter of a Web Agent.

**Note:** For information about changing the parameters of a Web Agent, see the SiteMinder Web Agent Configuration Guide.

The Policy Server uses an algorithm to generate dynamic keys at a regular interval. These keys are saved in the key store. When a Web Agent detects new keys, it retrieves them from the key store.

Agent Keys Used in Dynamic Key Rollover

SiteMinder deployments use the following keys in a dynamic key rollover and maintain them in the key store:

- **An Old Key** is a Dynamic key that contains the last value used for the Agent key before the current value.
- **A Current Key** is a Dynamic key that contains the value of the current Agent key.
- **A Future Key** is a Dynamic key that contains the next value that will be used as the Current key in an Agent key rollover.
- **Static Key**

When the Policy Server processes a dynamic Agent key rollover, the value of the current key replaces the value of the old key. The value of the future key replaces the value of the current key, and the Policy Server generates a new value for the future key.

When receiving a cookie from a client browser, the Web Agent uses the current key from the key store to decrypt the cookie. If the decrypted value is not valid, the Web Agent tries the old key, and if necessary, the future key. The old key may be required to decrypt cookies from an Agent that has not yet been updated, or to decrypt existing cookies from a client’s browser. The future key may be required for cookies created by an updated Agent, but read by an Agent that has not yet polled the key store for updated keys.
Rollover Intervals for Agent Keys

At a specified time, the Agent key rollover process begins. To prevent multiple rollovers from multiple Policy Servers, each server sets a rollover wait time of up to 30 minutes. If no update has been performed by the end of the wait time, that Policy Server updates the keys.

All Policy Servers wait for updated keys and then process the new keys to their Agents. Even for a single Policy Server, the update time may be up to 30 minutes beyond the time specified for the rollover.

The Agent Key Rollover process begins at the time(s) specified in the SiteMinder Agent Key Management dialog box. The process can take up to three minutes. In that time period, all Web Agents connected to the Policy Server receive updated keys.

Note: In a deployment that involves multiple replicated Policy Servers, the process for distributing Agent keys may take up to 30 minutes.

Static Keys

A static key is a string used to encrypt data which remains constant. In a SiteMinder deployment that uses the Agent Key rollover feature, a static key provides a method for maintaining user information across an extended period of time.

The following SiteMinder features and situations make use of the static key:

- Saving User Credentials for HTML Forms Authentication
  If an HTML Forms authentication scheme has been configured to allow users to save credentials, the Policy Server uses the static key to encrypt the user’s credentials.

- User Tracking
  If user tracking is turned on, the Policy Server uses the static key to encrypt user identity information.

- Single Sign-on Across Multiple Key Stores
  In a SiteMinder deployment that includes multiple key stores, the static key may be used for single sign-on. In this situation, SiteMinder Agents use the static key for all cookie encryption.

  Note: If you change the static key, any cookies created with the former static key are invalid. Users may be forced to re-authenticate, and user tracking information becomes invalid. In addition, if the static key is used for single sign-on, users are challenged for credentials when they attempt to access resources in another cookie domain.
Session Ticket Keys

When a user successfully logs into a protected resource, the Policy Server creates a session ticket. The session ticket is what the Policy Server uses to determine how long a user's authentication remains valid. This session ticket is encrypted using the session ticket key and cached in the Agent User Cache.

You can choose to have the Policy Server generate the session ticket key using an algorithm, or you can enter a session ticket key in the SiteMinder Key Management dialog box. For security reasons, the randomly generated key is recommended. However, if your SiteMinder implementation includes multiple key stores in a single sign-on environment, you must enter the same session ticket key for all key stores.

Key Management Scenarios

There are three types of scenarios for key management based on how you implement Policy Servers, policy stores and key stores, along with your single sign-on requirements. These scenarios include:

- Common Policy Store and Key Store
  
  In this scenario, a group of Policy Servers shares a single policy store and key store, providing access control and single sign-on in a single cookie domain.

  The policy store data is maintained in a single policy store. Key data is maintained in a single key store. The key store may be part of the policy store, or may be a separate store.

  Both policy store and key store data may be replicated for failover purposes. Replication must be configured based on the database or directory type selected for the policy store. For information about replication schemes, consult the documentation provided by your database or directory vendor.

More information:

Multiple Policy Stores with Separate Key Stores (see page 60)

Cache Management Overview (see page 95)
Manage the Session Ticket Key (see page 68)
Key Management Scenarios

- **Multiple Policy Stores with a Common Key Store**
  
  In this scenario, groups of Policy Servers connect to separate policy stores, but share a common key store, providing access control and single sign-on across multiple cookie domains.

  The policy store data for each group of Policy Servers is maintained in a single policy store. Key data for all groups of Policy Servers is maintained in a single key store. The separate key store allows Agents associated with all Policy Servers to share keys, enabling single sign-on across separate cookie domains.

  Both policy store and key store data may be replicated for failover purposes. Replication must be configured based on the database or directory type selected for the policy store. For information about replication schemes, consult the documentation provided by your database or directory vendor.

- **Multiple Policy Stores and Multiple Key Stores**
  
  In this scenario, each group of Policy Servers shares a single policy store and key store, providing access control and single sign-on across multiple cookie domains where it is desirable for the Policy Servers in each cookie domain to have a separate key store.

  The policy store data for each group of Policy Servers is maintained in a single policy store. Key data for each group of Policy Servers is maintained in a single key store. The key store may be part of the policy store, or may be a separate store. The same set of static keys allows for single sign-on across all Web Agents.

  Both policy store and key store data may be replicated for failover purposes. Replication must be configured based on the database or directory type selected for the policy store. For information about replication schemes, consult the documentation provided by your database or directory vendor.

**More information:**

Configure LDAP Failover (see page 35)
Configure ODBC Failover (see page 38)
Key Management Considerations

When deciding on the key management scenario for your enterprise, consider the following:

- When configuring dynamic keys in an environment with multiple Policy Servers that share a common key store, a single Policy Server must be nominated to perform Agent Key generation. You should disable key generation on all other Policy Servers.

- In a network configuration with multiple Policy Servers, the Policy Server Management Console enables you to specify a policy store for each Policy Server. Policy stores can be master policy stores that are the primary location for storing SiteMinder objects and policy information, or they can be replicated policy stores that use data copied from a master policy store.

- Master/slave directories or databases must be configured according to the specifications of the directory or database provider. The Policy Server provides the ability to specify a failover order for policy stores, but it does not control data replication. For information about replication schemes, see your directory or database provider’s documentation.

- In any network that uses dynamic key rollover, the key store for a Policy Server may be a master key store or a replicated slave key store. Master key stores receive keys directly from the Policy Server process that generates the keys. Slave key stores receive copies of the keys in the master key store.

- In a master/slave environment, you must configure key generation from Policy Servers that point to the master policy store and key store. The master policy store and key store data must then be replicated across all other policy stores and key stores included in your failover order.

- In any single sign-on environment for multiple cookie domains, dynamic keys can only be used if there is a single master key store, or slave key stores with keys replicated from a single master key store.

- Policy stores and keys stores can be installed on mixed LDAP and ODBC directories. The policy store can reside in an ODBC database and the key store can reside in an LDAP Directory Server or vice versa. For a list of supported databases, go to the Technical Support site and search for the SiteMinder r12.0 SP2 Platform Support Matrix.

More information:

Configure Agent Key Generation (see page 65)
Configure LDAP Failover (see page 35)
Configure ODBC Failover (see page 38)
Common Policy Store and Key Store

The simplest scenario for a SiteMinder configuration that uses key rollover is when multiple Policy Servers use a single policy store (and its associated failover policy stores), along with a single key store.

The following figure shows multiple Policy Servers using a single policy store.

In this type of configuration, Policy Servers retrieve dynamic keys from the key store. The Web Agents associated with the Policy Servers collect new keys from the Policy Servers.

More information:

Key Management Considerations (see page 57)

Multiple Policy Stores with a Common Key Store

If a network configuration consists of multiple Policy Servers with separate policy stores in a single sign-on environment, it is possible to have a common key store that all of the Policy Servers use for key rollover.
The following figure shows multiple Policy Servers using a common key store.

One Policy Server generates dynamic keys and stores them in the central key store. Each Policy Server is configured using the Policy Server Management Console to use the central key store; Agent key generation should be disabled for all other Policy Servers. Agents poll their respective Policy Servers to retrieve new keys. The Policy Servers retrieve new keys from the common key store and pass them to the SiteMinder Agents.

**Note:** This scenario requires an additional registry setting that forces Policy Servers that are not generating keys to poll the key store for key updates.

**More information:**

[Key Management Considerations](see page 57)
[Set the EnableKeyUpdate Registry Key](see page 70)
Multiple Policy Stores with Separate Key Stores

If a network configuration is composed of multiple Policy Servers, policy stores, and master key stores, an administrator with appropriate privileges can specify the same static key and session ticket key for each policy store in order to facilitate one or more of the following:

- Single sign-on across all Agents
- Password Services with a common user directory

The following figure shows an environment with multiple Policy Servers and stores.

In the previous example, the same static key is used to encrypt all cookies created by SiteMinder Web Agents.

More information:

Key Management Considerations (see page 57)
Reset the r6.x Policy Store Encryption Key

To reset the r6.x policy store encryption key

1. Log into a Policy Server host system.
2. Run the following command:
   
   ```bash
   smobjexport -dsiteminder_administrator -w password -ofile_name <command>
   ```

   `-dsiteminder_administrator`
   Specifies the name of the SiteMinder administrator account.

   **Note:** This administrator must be able to manage all SiteMinder domain objects.

   `-w password`
   Specifies the password of the SiteMinder administrator account.

   `-ofile_name`
   Specifies the following:
   - The path to the output location
   - The name of smdif file the utility creates

   **Note:** If this argument is not specified, the default output file names are stdout.smdif and stdout.cfg.

   `-c`
   Exports sensitive data as clear-text.
   The utility exports the policy store data into the smdif file.

3. Be sure that the smreg utility is located in `policy_server_home\bin`.

   **policy_server_home**
   Specifies the Policy Server installation path.

   **Note:** If the utility is not present, you can find the utility in the Policy Server installation media, which is available on the Support site.

4. Run the following command:
   
   ```bash
   smreg -key encryption_key
   ```

   **encryption_key**
   Specifies the new encryption key.

   **Limits:** 6 to 24 characters.
   The policy store encryption key is changed.

5. Start the Policy Server Management Console and open the Data tab.
6. Re-enter the policy store administrator password and click Update. 
   The administrator password is re-encrypted using the new encryption key.

7. Run the following command:
   ```
   smreg -su password
   
   password
   ```
   Specifies the SiteMinder super user password.
   The super user password is set and encrypted using the new encryption key.

8. Run the following command:
   ```
   smobjimport -dsiteminder_administrator -wpassword -i file_name -r -f
   
   -dsiteminder_administrator
   ```
   Specifies the name of the SiteMinder administrator account.
   **Note:** This administrator must be able to manage all SiteMinder domain objects.

   ```
   -wpassword
   ```
   Specifies the password of the SiteMinder administrator account.

   ```
   -i file_name
   ```
   Specifies the following:
   - The path to the smdif file
   - The name of the smdif file name
   **Note:** If this argument is not specified, the default input file names are stdout.smdif and stdout.cfg.

   ```
   -r
   ```
   Specifies that duplicate policy store information can be overwritten during the import.

   ```
   -f
   ```
   Turns off automatic renaming of objects. By default, when the utility attempts to import an object with a name that exists in the target policy store, the utility creates a duplicate object. The name of the object is nameoid.

   ```
   name
   ```
   Specifies the name of the object.

   ```
   oid
   ```
   Specifies the object ID of the new duplicate object.
   The utility returns errors messages for any objects that could not be created because of naming conflicts.
Reset the r12.x Policy Store Encryption Key

9. Run the following command:
   smreg -su password
   
   password
   Specifies the SiteMinder super user password.
   The super user password is set.
   The policy store encryption key is reset.

Reset the r12.x Policy Store Encryption Key

To reset the r12.x policy store encryption key
1. Log into the Policy Server host system.
2. Run the following command:
   XPSExport output_file -xa -xs -xc -passphrase passphrase
   
   output_file
   Specifies the name of the XML file to which the policy store data is exported.
   
   -xa
   Specifies that all policy store data be exported.
   
   -xs
   Specifies that security data be exported.
   
   -xc
   Specifies that configuration data be exported.
   
   -passphrase passphrase
   Specifies the passphrase that is required for the encryption of sensitive data.

   Limits: The passphrase must:
   - Be at least eight characters long
   - Contain at least one uppercase and one lowercase character
   - Contain at least one numeric digit

   Note: If the passphrase contains a space, enclose the passphrase with quotes.

   The utility exports the policy store data to the XML.
3. Be sure that the smreg utility is located in \textit{policy\_server\_home}/bin.

\textit{policy\_server\_home}

Specifies the Policy Server installation path.

\textbf{Note:} If the utility is not present, you can find the utility in the Policy Server installation media, which is available on the Support site.

4. Run the following command:

\texttt{smreg -key encryption\_key}

\texttt{encryption\_key}

Specifies the new encryption key.

\textbf{Limits:} 6 to 24 characters.

The utility changes the policy store encryption key.

5. Run the following command:

\texttt{XPSImport input\_file -fo -passphrase passphrase}

\texttt{input\_file}

Specifies the name of the XML file that contains the exported policy store data.

\texttt{-fo}

Allows existing policy store data to be overwritten.

\texttt{-passphrase passphrase}

Specifies the passphrase required for the decryption of sensitive data.

\textbf{Important!} If the passphrase does not match the passphrase entered during the policy store export, sensitive data cannot be decrypted and the import fails.

The utility imports the policy store data.

The policy store encryption key is reset.
Configure Agent Key Generation

You use the Policy Server Management Console Keys tab to configure how the Policy Server handles Agent key generation.

**Note:** Enable key generation only on the Policy Server that you want to generate Agent keys.

**To configure Policy Server agent key generation**

1. Start the Policy Server Management Console.
   
   **Important!** If you are accessing this graphical user interface on Windows Server 2008, open the shortcut with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

2. Click the Keys tab.

3. Complete the fields and controls presented on the Keys tab to configure Agent key generation.

4. When you are done, click Apply to save your changes.

Manage Agent Keys

The SiteMinder Key Management dialog box, which you access from the Administrative UI, enables you to configure periodic Agent key rollovers, execute manual rollovers, and change the static key. It also enables you to manage the session ticket key.

**Note:** To manage keys, you must log into the Administrative UI using an account with the Manage Keys and Password Policies privilege. For more information, see the *Policy Server Configuration Guide*.

**More information:**

- [Manage the Session Ticket Key](#) (see page 68)
- [Configure Periodic Key Rollover](#) (see page 66)
- [Manually Rollover the Key](#) (see page 66)
- [Change Static Keys](#) (see page 67)
Configure Periodic Key Rollover

The Policy Server supports periodic Agent key rollovers weekly, daily, or at fixed intervals in a single day. The shortest allowable period between rollovers is one hour.

Note: If your operating system is not configured to adjust the system time for daylight savings time, key rollover may be offset by one hour. To ensure that key rollover occurs at the expected time, configure your operating system to recognize daylight savings time.

To configure periodic key rollover
1. In the Policy Server Management Console, select Enable Agent Key Generation check box in the Keys tab and click OK.
2. Log into the Administrative UI.
3. From the Administration tab, select Policy Server, Key Management.
   The Key Management pane opens.
4. In the Agent Key group box, select Use dynamic Agent Key.
   The pane changes to support dynamic keys.
5. In the Dynamic Key Detail group box, select Automatic key rollover then click Set rollover frequency.
   The Dynamic Key Rollover group box appears.
6. Set the frequency of the automatic key rollover.
7. Click OK.
   You return to the Key Management pane.

Manually Rollover the Key

One of the Agent key management features lets you manually rollover dynamic Agent keys. This feature provides added security because the keys can be rolled over at any time. You can also use this feature if you want the Policy Server to generate dynamic keys, but you do not want the keys to rollover at a fixed interval.

To manually rollover dynamic Agent keys
1. Log into the Administrative UI.
2. From Administration tab, select Policy Server, Key Management.
   The Key Management pane opens.
3. In the Agent Key group box, select Use dynamic Agent Key.
   The pane changes to support dynamic keys.

4. In the Dynamic Key Detail group box, select Manual Key Rollover.

5. To rollover dynamic keys, click Rollover Now.
   The Policy Server immediately generates new Agent keys. Unless you manually execute an Agent key rollover, the Policy Server does not generate new dynamic keys automatically.
   
   **Note:** Do not click this button multiple times unless you want to rollover keys more than once.

Web Agents pick up the new keys the next time they poll the Policy Server, which may take up to three minutes due to cache synchronization. If you want to use an entirely new set of keys for security reasons, you can rollover dynamic keys twice to remove the old key and the current key from the key store.

### Coordinate Agent Key Management and Session Timeouts

You must coordinate the updating of agent keys and session timeouts or you may invalidate cookies that contain session information. This coordination is critical because the person designing policies in your organization may be different than the person configuring dynamic key rollover.

Session timeouts should be less than or equal to two times the interval configured between Agent key rollovers. If an administrator configures an agent key rollover to occur two times before a session expires, cookies written by the Web Agent before the first key rollover will no longer be valid and users will be re-challenged for their identification before their session terminates.

For example, if you configure key rollover to occur every three hours, you should set the Maximum Session timeout to six hours or less to ensure that multiple key rollovers do not invalidate the session cookie.

### Change Static Keys

You can change the static Agent key used by SiteMinder Web Agents to encrypt identity information for certain SiteMinder features.

**Important!** Changing the static key is not recommended because the change can cause some SiteMinder features to lose the data they require to function properly. Features that establish and use an identity stored in a persistent cookie will no longer work. Change the static key *only* in extreme situations such as security breaches. Authenticated users may be forced to login again before single sign-on will function across multiple SiteMinder installations.
A static key may also be used to maintain a single sign-on environment in an environment that requires multiple Policy Servers and multiple master key stores.

**To change the static key**

1. Log into the Administrative UI.
2. From the Administration tab select Policy Server, Key Management.
   The Key Management pane opens.
3. In the Agent Key group box, select Use Static Key.
   The pane changes to support static keys.
4. Do one of the following:
   - In the Generate a random key group box, click Rollover Now to make the Policy Server generate a new random static key.
   - In the Specify an Agent key group box, enter a static key by setting the following fields:
     - **Static key**
       Specify a value that the Policy Server uses as the static key. Use this option in situations where two key stores must use the static key to maintain a single sign-on environment.
     - **Confirm key**
       Re-enter the static key.
5. Click Rollover Now.
   Depending on the option you selected, the Policy Server generates a new static key or uses the one you specified. The static key rolls over within three minutes.
6. Click Submit to save your changes.

**Manage the Session Ticket Key**

The Policy Server can generate the session ticket key using an algorithm, or you can enter the session ticket key manually. A session ticket is established each time a user authenticates successfully and enables the Policy Server to determine how long a user’s session can continue.

**Note:** The only implementation that requires a manually assigned session ticket key is one that includes multiple, independent key stores. Automatically generated keys cannot be propagated across independent key stores by the Policy Server. In all other instances it is recommended that you use the session ticket key generated by the Policy Server algorithm.
Generate a Session Ticket Key

The Policy Server can generate the session ticket key using a method similar to the one for generating dynamic Agent keys. Randomly generating the session ticket key enables the Policy Server to use an algorithm to create the key used for encryption and decryption.

To generate a session ticket key

1. Log into the Administrative UI.
2. From the Administration tab, select Policy Server, Key Management.
   The Key Management pane opens.
3. Do one of the following:
   - In the Generate a Random Session Ticket Key group box, click Rollover Now.
     The Policy Server generates a new session ticket key. This key immediately replaces the one that is used to encrypt and decrypt session tickets.
   - Specify a Session Ticket Key group box, complete the following fields:
     - **Session ticket key**
       Enter a value for the session ticket key. The Policy Server immediately replaces the existing session ticket key with the value you entered.
     - **Confirm**
       Re-enter the session ticket key.
4. Click Rollover Now.
5. Click Submit to save your changes.
Manually Enter the Session Ticket Key

If your Policy Server is part of an implementation that includes multiple key stores, you can manually enter the session ticket key.

To enter the session ticket key
1. From the Administration tab, select Policy Server, Key Management.
   The Key Management pane opens.
2. In the Specify a Session Ticket Key group box, enter values for the following fields:
   
   **Session Ticket Key**
   
   Enter a session ticket key
   
   **Confirm**
   
   Re-enter the session ticket key
3. Click Rollover Now.
   The Policy Server immediately replaces the existing session ticket key with the value you entered.
4. Click Submit.

Set the EnableKeyUpdate Registry Key

When a single Policy Server generates encryption keys in an environment with multiple Policy Servers that connect to disparate policy stores, but share a central key store, an additional registry setting is required. This registry setting configures each Policy Server to poll the common key store and retrieve new encryption keys at a regular interval.

To configure the EnableKeyUpdate registry key on a Windows Policy Server
1. From the Windows Start menu, select Run.
2. Enter regedit in the Run dialog box and click OK.
3. In the Registry Editor, navigate to:
   
   HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\ObjectStore
4. Change the following registry value:
   "EnableKeyUpdate"=0
   to
   "EnableKeyUpdate"=1

5. Restart the Policy Server.

To configure the EnableKeyUpdate registry key on a UNIX Policy Server

1. Navigate to:
   $install_directory/siteminder/registry

2. Open sm.registry in a text editor.

3. Locate the following text in the file:
   HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\ObjectStore

4. Change the following registry value:
   "EnableKeyUpdate"=0
   to
   "EnableKeyUpdate"=1

5. Restart the Policy Server.

More information:

Multiple Policy Stores with a Common Key Store (see page 58)

Shared Secret for a Trusted Host

When you register a trusted host, the installation process automatically generates a shared secret for the Web Agent and stores that shared secret in the SmHost.conf file, the Host Configuration file. If you choose to enable shared secret rollover when registering a trusted host, you can rollover the shared secrets for trusted hosts. You can rollover shared secrets manually or periodically.

During a manual or periodic shared secret rollover, shared secrets are only rolled over for Agents that were configured at installation to allow rollovers.

For information about installing Web Agents and registering trusted hosts, see the SiteMinder Web Agent Installation Guide.
Shared secret rollover occurs automatically only on servers that are configured to enable Agent key generation. You enable Agent key generation by selecting the Enable Agent Key Generation check box in the Keys tab of the Policy Server Management Console. This setting is enabled by default.

**Important!** We recommend that only one Policy Server be enabled to generate keys. If there are multiple policy stores in an environment, but only a single shared key store, the shared secrets in the policy store are rolled over automatically only in the policy store for the Policy Server with key generation enabled. For the other policy stores, you can manually execute a rollover.

To manually rollover the shared secret, use the FSS Administrative UI or the C Policy Management API running on a Policy Server configured to the target policy store.

**Note:** The shared secret policy object is kept in the key store, and thus will be shared by all policy stores that share the same key store. The shared secrets themselves are kept in the trusted host objects, which are part of the policy store.

### Configure Trusted Host Shared Secret Rollover

The Policy Server supports manual and periodic rollover of shared secrets for trusted hosts.

Periodic rollovers can be configured hourly, daily, weekly, or monthly; one hour is the shortest allowable period between rollovers. The Policy Server initiates periodic rollovers based on the age of the shared secret for each trusted host, rather than at a specific time of the day, week, or month. By rolling over each shared secret as it expires, the processing associated with the rollover is distributed over time, and avoids placing a heavy processing load on the Policy Server.

If you use the manual rollover feature, future periodic rollovers will generally be clustered together for all trusted hosts, since the manual rollover sets new shared secrets for all trusted hosts that allow shared secret rollover.

**Important!** If you enable key generation on more than one Policy Server associated with a single policy store, the same shared secret can be rolled over more than once in a short period of time due to object store propagation delays. This can result in orphaned hosts whose new shared secrets have been discarded. To avoid this potential problem, enable shared secret rollover for a single Policy Server per policy store.
**To configure shared secret rollover for trusted hosts**

1. In the Keys tab of the Policy Server Management Console, ensure that the Enable Agent Key Generation check box is selected.
2. Log into the Administrative UI.
4. In the Shared Secret Rollover group box, do one of the following:
   - For an immediate rollover, click Rollover Now.
   - To ensure that the shared secret is never rolled over, select Never Rollover Shared Secret.
   - To specify a period rollover, select Rollover Shared Secret every and complete the following fields:
     - **Rollover Frequency**
       Enter an integer for the number of times a rollover should occur. This number works together with the value of the rollover period.
     - **Rollover Period**
       From the pull-down list, select Hours, Days, Weeks or Months for the occurrence of the rollover.

The Policy Server begins the process of rolling over shared secrets for all trusted hosts configured to allow shared secret rollover. The rollover may take some time depending on the number of trusted hosts in your deployment.

5. Click Submit to save your changes.
Chapter 7: Configuring Policy Server Logging

This section contains the following topics:

Policy Server Logging Overview (see page 75)
Configure the Policy Server Logs (see page 75)
Report Logging Problems to the System Log (see page 81)

Policy Server Logging Overview

The Policy Server log file records information about the status of the Policy Server and, optionally, configurable levels of auditing information about authentication, authorization, and other events in the Policy Server log file. If the Policy Server is configured as a RADIUS Server, RADIUS activity is logged in the RADIUS log file.

You configure these logs from the Management Console Logs tab.

Configure the Policy Server Logs

To configure the Policy Server logs

1. Start the Policy Server Management Console.
   
   **Important!** If you are accessing this graphical user interface on Windows Server 2008, open the shortcut with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

2. Click the Logs tab.

3. Adjust the settings presented in the Policy Server Log and Policy Server Audit Log group boxes to configure the location, rollover characteristics and required level of audit logging for the Policy Server log.

4. If the Policy Server is configured as a RADIUS server, adjust the settings presented in the RADIUS Log group box.

5. Click Apply to save your changes.
Configure the Policy Server Logs

Record Administrator Changes to Policy Store Objects

You can specify whether changes made to policy store objects by administrators are recorded in the Policy Server audit logs.

The audit logs are stored as text files, as shown in the following example:

`policy_server_home/audit/xps-process_id-start_time-audit_sequence.file_type`

The name of each audit log file contains the following information:

`process_id`
Indicates the number of the process associated with the audited event.

`start_time`
Indicates the time the transaction started in the following format:

`YYYYMMDDHHMMSS`
A four-digit year and the 24-hour clock are used.

**Example:** 20061204133000

`audit_sequence`
Provides a sequence number for the audited event.

`file_type`
Indicates one of the following event types:

`access`
Indicates an audit log file that contains the following access events:

- a Administrative UI or a reports server is registered
- a Administrative UI or a reports server acts as a proxy on behalf of another user
- an administrator is denied access for a requested action

`audit`
Indicates an audit log file that contains the following events:

- an object is modified (using an XPS Tool or Administrative UI)
- administrator records are created, modified, or deleted

`txn`
Indicates an audit log file that contains the following transaction events:

- An XPS tool begins, commits, or rejects a change to an object.
**Note:** If you do not have write access to the SiteMinder binary files (XPS.dll, libXPS.so, libXPS.sl), an Administrator must grant you permission to use the related XPS command line tools using the Administrative UI or the XPSSecurity tool.

**To track administrator changes to policy store objects**

1. Open a command line on the Policy Server, and enter the following command:
   ```bash
   xpsconfig
   ```
   The tool starts and displays the name of the log file for this session, and a menu of choices opens.

2. Enter the following:
   ```bash
   xps
   ```
   A list of options appears.

3. Enter the following:
   ```bash
   1 (AuditEnabled)
   ```
   The current policy store audit settings appear.

4. Enter C.
   **Note:** This parameter uses a value of TRUE or FALSE. Changing its value toggles between the two states.
   The updated policy store audit settings appear. The new value is shown at the bottom of the list as "pending value."

5. Do the following:
   a. Enter Q twice.
   b. Enter L.
   c. Enter Q to end your XPS session.
   Your changes are saved and the command prompt appears.
How to Process Old Log Files Automatically

You can configure SiteMinder Policy Server to automatically process old log files by customizing one of the following scripts:

- Harvest.bat (Windows)
- Harvest.sh (UNIX or Linux)

The script runs when one of the following events occurs:

- When the XPSAudit process starts (using the following option)
  
  **CLEANUP**
  
  Processes all of the log files in the directory at once.

- Whenever the log files are rolled over

- When the XPSAudit process exits
  
  During a rollover or an exit, the files are processed one-at-a-time by file name.

You can customize the script to process the files any way you want. For example, you could modify the script to delete them, move them to a database or archive them to another location.

**Note:** This script is provided only as an example. It is not supported by CA.

To automatically process old log files, do the following:

1. Open the following directory on your Policy Server:
   
   `policy_server_home/audit/samples`

2. Open the appropriate script for your operating system with a text editor, and then save a copy to the following directory:
   
   `policy_server_home/audit/Harvest.extension`

   **Note:** Do not rename the file or save it to a location different from the one specified.

3. Use the remarks in the script as a guide to customize the script according to your needs.

4. Save your customized script and close the text editor.
How to Include SiteMinder Administrative Audit Events in Reports

If you already have a SiteMinder report server and an audit database, you can configure your SiteMinder Policy server to collect administrative audit events that you can import one of the following report database types:

- Oracle database
- Microsoft SQL Server database

After the data is imported, you can include it in any reports you generate using the SiteMinder report server.

A sample Perl script is installed with the SiteMinder Policy Server that you can customize to meet your needs.

To include administrative audit events in your SiteMinder reports, use the following process:

1. Copy the sample scripts on the Policy Server by doing the following:
   a. Open the following directory:
   
   policy_server_home\audit\samples

   **Note:** The following directories are the default locations for the policy_server_home variable:

   - C:\Program Files\ca\siteminder (Windows)
   - /opt/ca/siteminder (UNIX, Linux)

   b. Locate the following files:

   - Harvest.bat (for Windows)
   - Harvest.sh (for UNIX, Linux)
   - ProcessAudit.pl
   - Categories.txt

   c. Copy the previous files to the following directory:

   policy_server_home\audit

2. (Optional) Customize the ProcessAudit.pl script.

3. After the next scheduled run of the XPSAudit command, copies of the audit logs are created using the comma-separated value (CSV) format, and stored as .TMP files in the following directory:

   policy_server_home\audit\R6tmp

4. Copy the .TMP files from the previous directory on the Policy Server to the server that hosts your audit database.

5. Create one of the following files to map the CSV-formatted contents of the .TMP files to your database schema:
Configure the Policy Server Logs

- `control_file_name.ctl` (control file for Oracle databases)
- `format_file_name.fmt` (format file for SQL Server databases)

**Note:** For more information, see the documentation or online help provided by your database vendor.

6. On the server that hosts your audit database, run whichever of the following commands is appropriate for your type of database:
   - `sqlldr` (for Oracle databases)
   - `bcp` (for SQL Server databases)

**Note:** For more information, see the documentation or online help provided by your database vendor.

7. After the command finishes, use the reports server to generate a report of administrative events.
   The administrative audit events appear in the report.

---

**Mirror ODBC Audit Log Content in Text-based Audit Logs on Windows**

When the SiteMinder audit logs are stored as text files, they include a partial list of the available fields by default. If you want the text files that contain your audit logs to include all of the available fields, like an ODBC Audit database does, you can add a registry key to your Policy Server.

**To mirror ODBC Audit log content in text-based audit logs**

1. Open the registry editor.
2. Expand the following location:
   ```plaintext```
   HKEY_LOCAL_MACHINE\Netegrity\SiteMinder\CurrentVersion\Reports\
   ```plaintext```
3. Create a new DWORD value with the following name:
   ```plaintext```
   Enable Enhance Tracing
   ```plaintext```
4. Set the Value to 1. If you want to disable this setting in the future, change the value back to 0.
5. Restart your Policy Server.
   The ODBC Audit log content will appear in your text-based audit logs.
Mirror ODBC Audit Log Content in Text-based Audit Logs on Solaris

When the SiteMinder audit logs are stored as text files, they include a partial list of the available fields by default. If you want the text files that contain your audit logs to include all of the available fields, like an ODBC Audit database does, you can add a registry key to your Policy Server.

**To mirror ODBC Audit log content in text-based audit logs**

1. Open the following file:
   
   `sm.registry`

2. Locate the following line:
   
   `- HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\Reports=25089`

3. Add a new line beneath the previous one with the following text:
   
   `- Enable Enhance Tracing= 0x1; REG_DWORD`

   **Note:** If you want to disable this feature in the future, change the 0x1 to 0x0.

   
   The ODBC Audit log content will appear in your text-based audit logs.

Report Logging Problems to the System Log

You can configure the Policy Server to log information about exceptions that can occur while preparing or executing audit logs to the Windows event log viewer. This configuration can prevent you from missing this information in a production environment where debug logs are disabled. To configure this feature, set the value of the CategoryCount registry key to 7.

The CategoryCount registry key is found in the following registry location:

HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Eventlog\Application\SiteMinder

These events are logged under the event log categories ObjAuditLog and AccessAuditLog.

SiteMinder calls object events when objects are created, updated, or deleted. Any exceptions that occur while preparing/executing SiteMinder obj audit logs are logged to Windows event viewer under the 'ObjAuditLog' category.
Access events result from user-related activities and are called in the context of authentication, authorization, administration, and affiliate activity. Any exceptions that occur while preparing/executing SiteMinder access audit logs are logged to Windows event viewer under the 'AccessAuditLog' category.
Chapter 8: Configuring the Policy Server Profiler

This section contains the following topics:

Configure the Policy Server Profiler (see page 83)
Manually Roll Over the Profiler Trace Log File (see page 86)

Configure the Policy Server Profiler

The Policy Server Profiler allows you to trace internal Policy Server diagnostics and processing functions.

To configure the profiler

1. Start the Policy Server Management Console.

   **Important!** If you are accessing this graphical user interface on Windows Server 2008, open the shortcut with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

2. Click the Profiler tab.

3. Set the Enable Profiling option to enable profiling.

4. To select configuration settings for the Profiler, do one of the following:

   ■ Accept the Profiler settings specified by the default smtracedefault.txt file presented in the Configuration File drop-down list.

   ■ Select another configuration file that has already been selected during this management session from the Configuration File drop-down list.

   ■ Click the Browse button to select another configuration file.

5. To change the Profiler settings stored in a Profiler configuration file and save them in the same or a new file, click the Configure Settings button to open the Policy Server Profiler dialog.

6. Adjust the settings presented in the Output group box to specify the output format for information generated by the Policy Server Profiler.

7. Click Apply to save your changes.
Configure the Policy Server Profiler

Notes:

Changes to the Profiler settings take effect automatically. However, if you restart the Policy Server, a new output file (if the Profiler is configured for file output) is created. The existing Profiler output file is automatically saved with a version number. For example:

smtracedefault.log.1

If changes to the Logging or Tracing facility settings are not related to the Profiler output file, for example, enabling/disabling the console logging on Windows, the existing file is appended with new output without saving a version of the file.

By default The Policy Server retains up to ten output files (the current file and nine backup files). Older files are replaced automatically with newer files when the ten file limit is reached. You can change the number of files to retain by configuring the TraceFilesToKeep DWORD registry setting to the required decimal value. The TraceFilesToKeep registry setting must be created in the following registry location:

HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\LogConfig\TraceFilesToKeep

Change Profiler Settings

You can specify which components and data fields will be included in Policy Server tracing, and you can apply filters to tracing output so that the profiler only captures specific values for a given component or data field.

To configure profiler settings

1. Start the Policy Server Management Console.

   **Important!** If you are accessing this graphical user interface on Windows Server 2008, open the shortcut with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

2. Click the Profiler tab.

3. Click the Configure Settings button.

   **Note:** This button is only active when you select the Enable Profiling check box.

   The Policy Server Profiler dialog opens.
4. Optionally, choose a Profiler template file that contains a predefined set of components and data fields appropriate for a particular tracing task from the Template drop down list:

**general_trace.template**

Provides options for general, broad scope tracing.

**authentication_trace.template**

Provides options for tracing user authentications.

**authorization_trace.template.txt**

Provides options for tracing user authorizations.

You can use Profiler templates as a starting point for Profiler configuration. Once a template has been loaded, you can manually modify the components and data fields that it specifies as well as apply data filters.

5. Review/configure trace options by doing one or more of the following:

   - Select Components—Specify which components—actions executed by the Policy Server—to trace on the Components tab.
   - Select Data Fields—Specify which data fields—actual pieces of data used by the Policy Server to complete its tasks—to trace on the Data tab.
   - Add Filters—Specify data filters that will include or exclude information from the tracing process on the Filters tab.

6. To save your new settings, do one of the following:

   - To save the settings in the currently selected configuration file, click OK.
   - To save the settings to a new configuration file, select File, Save As and specify a new text file.

7. Select File, Close to close the profiler and return to the Policy Server Management Console.

8. Select the Browse button to the right of the Configuration File field.

---

**Avoid Profiler Console Output Problems on Windows**

On Windows Policy Servers, you should disable QuickEdit Mode and Insert Mode to avoid problems when you enable console debugging. QuickEdit Mode and Insert Mode are features that you can enable from a Windows command prompt window.

**To Disable QuickEdit Mode and Insert Mode**

1. Access the command prompt window.
2. Right click in the window’s title bar to display the pull-down menu.
4. If QuickEdit Mode and Insert Mode are checked, deselect them.
5. Click OK.

Configure Profiler Trace File Retention Policy

By default the Policy Server retains up to ten output files (the current file and nine backup files). Older files are replaced automatically with newer files when the ten file limit is reached. You can change the number of files to retain by configuring the TraceFilesToKeep DWORD registry setting to the required decimal value. The TraceFilesToKeep registry setting should be created in the following registry location:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\LogConfig\TraceFilesToKeep
```

Manually Roll Over the Profiler Trace Log File

The Policy Server allows you to manually rollover the Policy Server Profiler trace log file using the smpolicysrv command.

**Important!** If you are running a SiteMinder utility or executable on Windows Server 2008, be sure to open the command-line window with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

To start trace logging to a file, run the following command:

```
smpolicysrv --starttrace
```

This command starts logging to a trace file and does not affect trace logging to the console. It issues an error if the Policy Server is not running.

If the Policy Server is already logging trace data, running the --starttrace command causes the Policy server to rename the current trace file with a time stamp appended to the name in the form:

```
file_name.YYYYMMDD_HHmmss.extension
```

and create a new trace file with the original name. For example, if the trace file name in Policy Server Management Console’s Profiler tab is C:\temp\smtrace.log, the Policy Server generates a new file and saves the old one as C:\temp\smtrace.20051007_121807.log. The time stamp indicates that the Policy Server created the file on October 7, 2005 at 12:18 pm.

If you have not enabled the tracing of a file feature using the Policy Server Management Console’s Profiler tab, running this command does not do anything.
To stop trace logging to a file, run the following command:

```
smpolicysrv -stoptrace
```

This command stops logging to a file and does not affect trace logging to the console. It issues an error if the Policy Server is not running.

**Note**: On Windows systems, do not run the `smpolicysrv` command from a remote desktop or Terminal Services window. The `smpolicysrv` command depends on inter-process communications that do not work if you run the `smpolicysrv` process from a remote desktop or Terminal Services window.

**Dynamic Trace File Rollover at Specified Intervals**

You can also write a script to cause a trace file to be rolled over at a specified time interval. For example, to create a new trace file every hour, write a script similar to the following:

```
smpolicysrv -starttrace
   repeat forever
   wait 1 hour
   smpolicysrv -starttrace
end repeat
```

This is similar to the time-based rollover option on the Policy Server Management Console’s Logs tab.
Chapter 9: Configuring Administrative Journal and Event Handler

This section contains the following topics:

Administrative Journal and Event Handler Overview (see page 89)
Configure Advanced Settings for the Policy Server (see page 89)

Administrative Journal and Event Handler Overview

The Policy Server Administrative Journal can be configured to specify how often administrative changes are applied to the Policy Server and how long the Policy Server maintains a list of applied changes.

Event Handlers are shared libraries that can be added to the Policy Server to handle certain events.

Configure Advanced Settings for the Policy Server

To configure the Policy Server advanced settings

1. Start the Policy Server Management Console.
   
   **Important!** If you are accessing this graphical user interface on Windows Server 2008, open the shortcut with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

2. Click the Advanced tab.

3. Adjust the settings presented in the Administrative Journal group box to configure how often administrative changes are applied to the Policy Server, and how long the Policy Server maintains a list of applied changes.

4. Click Apply to save your changes.
Add Event Handler Libraries

You can add additional event handler libraries to the SiteMinder Policy Server.

**Note:** If you do not have write access to the SiteMinder binary files (XPS.dll, libXPS.so, libXPS.sl), an Administrator must grant you permission to use the related XPS command line tools using the Administrative UI or the XPSSecurity tool.

**To add event handler libraries**

1. Open a command line on the Policy Server, and enter the following command:
   ```
   xpsconfig
   ```
   The tool starts and displays the name of the log file for this session, and a menu of choices opens.

2. Enter the following:
   ```
   xps
   ```
   A list of options appears.

3. Enter the following:
   ```
   5 (AuditSMHandlers)
   ```
   The settings for the event handler libraries appear.

4. Type C, and then enter the path and file name of the event handler library you want to add. Separate multiple library locations with commas.

   The settings for the event handler libraries appear. The value you added is shown at the bottom of the settings as a "pending value."

5. Do the following:
   a. Enter Q twice.
   b. Enter L.
   c. Enter Q to end your XPS session.

   Your changes are saved and the command prompt appears.

**More information:**

[Grant Access to XPS Tools](#) (see page 20)
[Event Handlers List Settings Warning when Opening Policy Server Management Console](#) (see page 230)
Chapter 10: Adjusting Global Settings

This section contains the following topics:

- Enable User Tracking (see page 91)
- Enable Nested Security (see page 92)
- Enable Enhanced Active Directory Integration (see page 92)

Enable User Tracking

The Policy Server Global Tools task lets you enable and disable user tracking. If you enable user tracking, SiteMinder Web Agents save Global Unique Identifiers (GUIDs) in cookies. When users access a resource protected by an Anonymous authentication scheme for the first time, the Web Agent creates a cookie that includes the user’s GUID. Each GUID is a unique value, therefore, it may be used to track an anonymous user and customize Web content.

Affiliate Agents require user tracking. If you are using SiteMinder for a network that includes Affiliate Agents, you must enable user tracking as described in the following procedure.

To enable user tracking

1. Log into the Administrative UI.
2. Click Administration, Policy Server, Global Tools.
   The Global Tools pane opens.
3. Select Enable User Tracking in the Global Settings group box.
4. Click Submit.
   The Policy Server enables user tracking.
Enable Nested Security

The Policy Server Modify Global Tools pane in the Administrative UI lets you enable and disable the nested security, which provides backwards compatibility for older versions of SiteMinder.

To enable the nested security option
1. Log into the Administrative UI.
2. Click Administration, Policy Server, Global Tools.
   The Global Tools pane opens.
3. Select the Enable Nested Security checkbox.
4. Click Submit.
   The Policy Server enables nested security.

Enable Enhanced Active Directory Integration

Active Directory 2000 and Active Directory 2003 have several user and domain attributes that are specific to the Windows network operating system (NOS) and are not required by the LDAP standard. These attributes are:

- accountExpires
- userAccountControl
- pwdLastSet
- unicodePwd
- lastLogon
- lastLogonTimestamp
- badPasswordTime
- badPwdCount
- lockoutTime
Enable Enhanced Active Directory Integration

Chapter 10: Adjusting Global Settings

- lockoutDuration
- pwdMaxAge

If you configure the Policy Server to use Active Directory as a user store, enable Enhanced Active Directory Integration from the Policy Server Global Tools task available from the Administrative UI. This option improves the integration between the Policy Server’s user management feature and Password Services with Active Directory by synchronizing Active Directory user attributes with SiteMinder mapped user attributes.

**Note:** The feature is not supported with ADAM.

**To enable enhanced Active Directory integration**

1. Log into the Administrative UI.
2. Click Administration, Policy Server, Global Tools.
   
   The Global Tools pane opens.
3. Select Enhance Active Directory Integration. By default this feature is disabled.
   
   **Note:** After enabling this feature, you must have administrator credentials to modify the AD user store and have privileges to update AD attributes. If you do not have these credentials and privileges, the Policy Server returns an error message.
4. Click Submit.
   
   The Policy Server enables enhanced Active Directory integration.
6. Open the Active Directory object for editing.
7. In the Root field, enter the default Windows domain’s DN as the user directory root. For example:
   
   dc=WindowsDomain,dc=com
   
   **Note:** AD-specific features may not work in the Root field is set to another value.
8. Click Submit.

**Note:** A password policy that disables an account after exceeding an inactivity period does not work properly if the Enhance Active Directory Integration feature is enabled with AD 2000. As a result, user account inactivity integration is not supported for AD 2000; use AD 2003 instead.
Chapter 11: Cache Management

This section contains the following topics:

- Cache Management Overview (see page 95)
- Configure Caches (see page 95)
- Flush Caches (see page 96)

Cache Management Overview

SiteMinder provides several caches that can be configured to maintain copies of recently accessed data (for example, user authorizations) to improve system performance. These caches should be configured to suit the nature of the data in your environment, but may also require periodic manual flushing.

SiteMinder deployments can be configured to maintain the following cache on the Policy Server:

- The User Authorization Cache stores user distinguished names (DNs) based on the user portion of policies and includes the users’ group membership.

SiteMinder also maintains an Agent Cache on each a SiteMinder Agent machine. The Agent Cache has two components:

- The Agent Resource Cache stores a record of accessed resources that are protected by various realms. This cache speeds up Agent to Policy Server communication, since the Agent knows about resources for which it has already processed requests.

- The Agent User Cache maintains users’ encrypted session tickets. It acts as a session cache by storing user, realm, and resource information. Entries in this cache are invalidated based on timeouts established by the realms a user accesses.

Configure Caches

You enable and configure Policy Server cache settings using the Policy Server Management Console. For more information about configuring the agent caches, see the Web Agent Configuration Guide.
Flush Caches

When you change SiteMinder objects, SiteMinder automatically flushes the appropriate cache entries. The cache settings also specify a regular interval for applying administrative changes. When making sensitive changes (for example, changing the access rights to highly critical information), you have the option of flushing SiteMinder caches manually. This manual step helps ensure that unauthorized users cannot access protected resources based on information stored in the caches.

Cache Management features are accessible from the Policy Server Global Tools pane in the Administrative UI. They let you force an update of SiteMinder data by manually flushing the following caches:

**All Caches**
- Enables you to flush all caches, including user sessions, resource information, and user directory caches (including certificate CRLs).

**User Session Caches**
- Enables you to force users to reauthenticate when they try to access protected resources.

**Resource Caches**
- Enables you to flush cached information about resources.

Flush All Caches

The Cache Management options provide a method for administrators to flush the contents of all caches. Flushing all caches may adversely affect the performance of a Web site, since all requests immediately following the cache flush must retrieve information from user directories and the policy store. However, this action may be necessary if critical user privileges and policy changes must go into effect immediately.

Cache management features are only available to administrators who have either the Manage Users or Manage System and Domain Objects privileges. The Flush All button is only available for administrators with the Manage System and Domain Objects. If the menu selection is not available, the administrator account you used to log in does not have enough privileges to access the cache function.
If your configuration contains two policy servers pointing to one policy store, you can ensure that the primary (object cache) is included in the Flush All command. This causes both the primary and secondary caches to be rebuilt from the policy store. To enable this functionality, you must add the following entry to the registry:

Registry Name - FlushObjCache
Type - DWORD
Value - 0 (default)
Location - HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\ObjectStore

**To flush all caches**

1. Log into the Administrative UI.
2. Click Administration, Policy Server, Cache Management
3. In the All Caches group box, click Flush All.
   
   **Note:** The Flush All button is only enabled for administrators that have both the Manage Users and Manage the SiteMinder Objects privileges.

   The Policy Server and associated SiteMinder Agents flush all caches. This process will take up to twice the time specified by your policy server poll interval while the Policy Server synchronizes caches.

4. Click Submit.
   
   All caches are cleared.

**Flush User Session Caches**

When a user successfully authenticates, the Policy Server begins a session for the authenticated user. During the user’s session, the Web Agent stores authorization information in the user cache. However, if you change user access rights, it may be necessary to force the Policy Server to flush user session information from the Web Agent’s cache. You can do this from the Administrative UI’s Modify Global Tools pane.

**To flush user sessions**

1. Log into the Administrative UI.
2. Click Administration, Policy Server, Cache Management.
   
   The Modify Global Tools pane appears.
3. In the User Session Caches group box, select one of the following options:

   **All**
   
   Flushing all user sessions from the user cache.

   **Specific User DN**
   
   Flushing a specific DN from the user cache.

   If you select this radio button, select the user directory from the Directory drop-down list that contains the DN you want to remove and then enter the distinguished name in the DN field. You must specify a user’s DN, not a group’s DN. If you do not know the DN, click Lookup and search for the DN.

   **Note:** The option to flush user caches is only enabled for administrators that have the Manage Users privilege.

4. Click Flush.

   Depending on the radio button you selected, SiteMinder flushes all users or a specific DN from the user cache. This process takes up to twice the time specified by your Policy Server poll interval while the Policy Server synchronizes caches.

5. Click Submit.

   The user session caches are cleared.

**Flush Resource Caches**

SiteMinder Web Agents stores information about specific resources that users access in a resource cache. The resource cache records the following:

- Record of the Resources that have been accessed by users
- Whether or not the resources are protected by SiteMinder
- If a resource is protected, how the resource is protected

If you change rules or realms, you may want the changes to take effect immediately. If so, you must flush the resource cache.

**Note:** For detailed information about flushing resource caches for a realm or for a specific policy, see the *Policy Server Configuration Guide*.

**To flush resource caches**

1. Log into the Administrative UI.
2. Click Administration, Policy Server, Cache Management.
3. In the Resource Caches group box, click Flush.
   
   This flushes all resource caches and forces Web Agents to authorize requests against the Policy Server. This process will take up to twice the time specified by your policy server poll interval while the Policy Server synchronizes caches.

   **Note:** For an administrator with the Manage Domain Objects privilege for specific policy domains, flushing all resource caches only flushes the caches for the realms within the administrator’s policy domains.

4. Click Submit.
   
   The resource cache are cleared.

**Flush the Requests Queue on the Policy Server**

Requests from SiteMinder agents are set to time out after a certain interval. However, the Policy Server continues to process all agent requests in the queue, even those requests that have timed out, in the order that they were received. The following situations can cause the queue to fill with agent requests faster than the Policy Server can process them:

- Network lag between the Policy Server and the policy store or user store databases
- Heavy loads on the policy store or user store databases
- Policy Server performance problems

When the Policy Server requests queue fills with agent requests, you can flush the timed-out agent requests from the queue, so that only the current agent requests remain. Only use this procedure in the following case:

1. Agent requests waiting in the Policy Server queue time out.
2. One or more Agents resend the timed-out requests, overfilling the queue.

**Important! Do not use -flushrequests in normal operating conditions.**

**To flush the requests queue on the Policy Server**

1. Open a command prompt on the Policy Server.
2. Run the following command:
   
   ```
smpolicysrv -flushrequests
   
   The request queue is flushed.
   ```
Flush Caches

**Note:** On Windows systems, do *not* run the smpolicysrv command from a remote desktop or Terminal Services window. The smpolicysrv command depends on inter-process communications that do not work if you run the smpolicysrv process from a remote desktop or Terminal Services window.

**Important!** If you are running a SiteMinder utility or executable on Windows Server 2008, be sure to open the command-line window with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

Flush the Policy Store Cache

Flushing the policy store caches flushes all of the current entries and reloads the cache with all of entries in the policy store. During the flush, the policy store cache is taken offline. The Policy Server either pauses or uses the policy store directly to make policy decisions.

**To flush the policy store cache**

1. Open the registry editor.
2. Navigate to `\HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\ObjectStore`.
3. Create the FlushObjCache registry key with the following values:
   - **Type:** DWORD
   - **Value:** 1 or 0
     - **1** Enables the key. When enabled, you can use the Flush All button on the Cache Management dialog to flush all Policy Server and associated SiteMinder Agent caches, including the policy store cache.
     - **0** Disables the key. When disabled, you can use the Flush All button on the Cache Management dialog to flush all Policy Server and associated SiteMinder Agent caches, excluding the policy store cache.
   - **Note:** If a value does not exist, the key is disabled.
4. Use the Cache Management dialog in the Administrative UI to flush all caches.
Chapter 12: User Session and Account Management

This section contains the following topics:

- User Session and Account Management Prerequisites (see page 101)
- Enable and Disable Users (see page 101)
- Manage User Passwords (see page 102)
- Auditing User Authorizations (see page 103)

User Session and Account Management Prerequisites

The Policy Server provides user session and account management functionality, allowing you to flush the session cache, enable and disable users, and manage passwords for individual users.

To manage user sessions and accounts, the following prerequisites must be met:

- You must have an administrator account with the Manage Users privilege.
- To enable or disable user accounts, the user directory that contains user information must be configured with a Disable User attribute.
- To change passwords or force password changes, a password policy must be configured on the Policy Server and the user directory that contains user information must be configured with the Password Data attribute.

Note: For more information about configuring administrator privileges, user directories, and password policies, see the Policy Server Configuration Guide.

Enable and Disable Users

SiteMinder begins a user session after a user logs in and is authenticated. SiteMinder stores user attributes in its user session cache. When you disable a user, the Agent flushes the session cache, removing user identification and session information.

When the user attempts to access additional resources in the current session, the Web Agent no longer has the user’s data in its cache. The Agent contacts the Policy Server and attempts to re-authenticate the user. The Policy Server determines that this user is disabled in the user directory and rejects the Agent’s request to authenticate, which ends the session.
**To enable or disable a user account**

1. Log into the Administrative UI.
2. Click Administration, Users, Manage User Accounts.
   The Manage User Accounts pane opens.
3. Select the user directory connection for the directory that contains the user you want to enable or disable.
4. Click the Search icon.
   The Policy Server displays the Directory Users pane.
5. Enter search criteria in the Users/Groups group box and click GO to execute a search for the user you want to enable or disable. The search criteria is determined by the type of user directory you selected. You can enter the search criteria as either an attribute and a value, or as an expression. You can click Reset to clear the search criteria.
   The Policy Server displays search results in the Users/Groups group box.
6. Select a single user from the list of results.
   The Change user's state group box contains a button. This button is labeled Enable for a disabled user, or Disable for an enabled user.
7. Click Enable/Disable.
   The Policy Server disables or enables the selected user by changing a value in the user’s profile.

**Manage User Passwords**

The Manage User Accounts pane in the Administrative UI enables you to force password changes for users, or change user passwords to new values.

Be sure that a password policy exists before you force users to change passwords. If no password policy exists, users will not be able to change their passwords, and therefore will not be able to access protected resources.

If you force a user to change passwords, and the user is accessing resources through an Agent that is not using an SSL connection, the user’s new password information will be received over the non-secure connection. To provide a secure change of passwords, set up a password policy that redirects the user over an SSL connection when changing passwords.

**To manage user passwords**

1. Log into the Administrative UI.
2. Click Administration, Users, Manage User Accounts.
   The Manage User Accounts pane opens.
3. Select the user directory connection for the directory that contains the user for whom you want to manage passwords.

4. Click the Search icon.

   The Policy Server displays the user directory search dialog box associated with the type of directory you selected from the Directory drop-down list.

5. Enter search criteria in the Users/Groups group box and click GO to execute a search for the user you want to enable or disable. The search criteria is determined by the type of user directory you selected. You can either enter an attribute and a value, or enter an expression. You can click Reset to clear the search criteria.

   The Policy Server displays search results in the Users/Groups group box.

6. Select a single user from the list of results.

7. To force the selected user to change passwords on their next login, click Force Password Change in the Reset User’s Password group box.

8. To change a user’s password to a new value, enter a new password in the Change user’s password group box. Re-enter the password to confirm.

   **Note:** The password that you specify is not constrained by any password policy but it is recorded in the user's password history.

---

**Auditing User Authorizations**

Use the Web Agent’s auditing feature to track and log successful authorizations stored in the user session cache, allowing you to track user activity and measure how often applications on your Web site are used.

When you select this option, the Web Agent sends a message to the Policy Server each time a user is authorized from cache to access resources. You can then run log reports that shows user activity for each SiteMinder session.

If you do not enable auditing, the Web Agent will only audit authentications and first-time authorizations.

**Note:** For instructions on how to enable auditing, see the *Web Agent Configuration Guide*. 
Web Agents automatically log user names and access information in native Web Server log files when users access resources. Included in the audit log is a unique transaction ID that the Web Agent generates automatically for each successful user authorization request. The Agent also adds this ID to the HTTP header when SiteMinder authorizes a user to access a resource. The transaction ID is then available to all applications on the Web server. The transaction ID is also recorded in the Web Server audit logs. Using this ID, you can compare the logs and follow the user activity for a given application.

To view the output of the auditing feature, you can run a SiteMinder report from the Administrative UI.
Chapter 13: Clustering Policy Servers

This section contains the following topics:

- Clustered Policy Servers (see page 105)
- Configure Clusters (see page 108)
- Configure a Policy Server as a Centralized Monitor for a Cluster (see page 109)
- Point Clustered Policy Servers to the Centralized Monitor (see page 110)

Clustered Policy Servers

Load balancing and failover in a SiteMinder deployment provide a high level of system availability and improve response time by distributing requests from SiteMinder Agents to Policy Servers. Defining clusters in combination with load balancing and failover further enhance the level of system availability and system response time.

Traditional round robin load balancing without clusters distributes requests evenly over a set of servers. However, this method is not the most efficient in heterogeneous environments, where computing powers differ, because each server receives the same number of requests regardless of its computing power.

Another problem with efficiency can occur when data centers are located in different geographical regions. Sending requests to servers outside a certain locale can lead to the increased network communication overhead, and in some cases to the network congestion.

To address these issues and to improve system availability and response time, you can define a cluster of Policy Servers and associated Web Agents configured to perform (software-based) load balancing and failover.

Policy Server clusters provide the following benefits over a traditional load balancing/failover scheme:

- Load is dynamically distributed between Policy Servers in a cluster based on server response time.
- A cluster can be configured to failover to another cluster when the number of available servers in the cluster falls below a configurable threshold.
The following figure illustrates a simple SiteMinder deployment using two clusters:

Consider Cluster A and Cluster B as distributed in two different geographical locations, separated by several time zones. By dividing the Web Agents and Policy Servers into distinct clusters, the network overhead involved with load balancing across geographically separate regions is only incurred if the Policy Servers in one of the clusters fail, requiring a failover to the other cluster.

More information:

Failover Thresholds (see page 107)
Clustered Environment Monitoring (see page 123)
Failover Thresholds

In any clustered SiteMinder environment, you must configure a failover threshold. When the number of available Policy Servers falls below the specified threshold, all requests that would otherwise be serviced by the failed Policy Server cluster are forwarded to another cluster.

The failover threshold is represented by a percentage of the Policy Servers in a cluster. For example, if a cluster consists of four Policy Servers, and the failover threshold for the cluster is set at 50%, when three of the four Policy Servers in the cluster fail, the cluster fails, and all requests fail-over to the next cluster.

The default failover threshold is zero, which means that all servers in a cluster must fail before failover occurs.

Hardware Load Balancing Considerations

If you are deploying a hardware load balancer between the SiteMinder Policy Server and Web Agents, consider the following:

- Do not configure a TCP heartbeat or health–check directly against the Policy Server TCP ports. Heartbeats and health–checks applied directly against the TCP ports of the Policy Server can adversely affect its operation.
- Design a comprehensive facility for the load balancer to test the operational health of the Policy Server.
- Consider the impact of a single Policy Server configuration on the Web Agent failover algorithm as opposed to a multiple Policy Server configuration.
- Consider performance and failure scenarios in Web Agent and Policy Server tuning and monitoring.
- If the load balancer is configured to proxy Agent-to-Policy-Server connections, consider the timeouts and the socket states of the load balancer.

**Note:** For more information about deploying a hardware load balancer between Web Agents and Policy Servers, see the related Knowledge Base article (KB ID 21135) on the Support site.

**More information:**

[Contact CA](#) (see page iii)
Configure Clusters

Policy Server clusters are defined as part of a Host Configuration Object. When a SiteMinder Web Agent initializes, the settings from the Host Configuration Object are used to setup communication with Policy Servers.

**Note:** For information about Host Configuration Objects, see the *Web Agent Configuration Guide* and the *Policy Server Configuration Guide*.

**To configure a cluster**

1. Select the Infrastructure tab.
   
   A list of tasks appears.

2. Select Agents, Create Host Configuration.
   
   The Create Host Configuration pane appears.

3. Select the Clusters tab.

4. In the Clusters group box, click Add.
   
   The Cluster Setup group box opens.

   **Note:** You can click Help for a description of fields, controls, and their respective requirements.

5. Enter the IP address and the port number of the Policy Server in the Host and Port fields respectively.

6. Click Add to Cluster.
   
   The Policy Server appears in the servers list in the Current Setup group box.

7. Repeat these steps to add other Policy Servers to the cluster.

8. Click OK to save your changes.
   
   Your return to the Host Configuration pane. The Policy Server cluster is listed in a table.
9. In the Failover Threshold Percent field, enter a percentage of the number of Policy Servers that must be active and click Apply.

   If the percentage of active servers in the cluster falls below the percentage you specify, the cluster fails over to the next available cluster in the list of clusters. This setting applies to all clusters that use the Host Configuration Object.

   **Important!** The Policy Server specified in the Configuration Values group box is overwritten by the Policy Servers specified in a cluster. This Policy Server is no longer used because a cluster is configured. For the value of the Policy Server parameter in the Configuration Values group box to apply, do not specify any Policy Servers in a cluster. If clusters are configured and you decide to remove the clusters in favor of a simple failover configuration using the Policy Server parameter in the Configuration Values group box, be sure to delete all Policy Server information from the cluster.

10. Click Submit to save your changes.

### Configure a Policy Server as a Centralized Monitor for a Cluster

The OneView Monitor can be configured to monitor a Policy Server cluster. To enable this configuration, one Policy Server must be set up as a centralized monitor with the other clustered Policy Servers pointing to it.

#### To configure a Policy Server as a centralized monitor

1. Start the Policy Server Management Console.

   **Important!** If you are accessing this graphical user interface on Windows Server 2008, open the shortcut with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

2. In the Settings tab, select Allow Incoming Remote Connections.

3. Click OK to save your changes and close the Policy Server Management Console.

4. Restart the OneView Monitor.

   This setting allows the centralized Policy Server monitor to accept remote connections from the other clustered Policy Servers.

   **Note:** The network channel between a Policy Server and a Monitor process is non-secure.

   After you configure a Policy Server as a centralized monitor, configure the Policy Server Management Console to point the other clustered Policy Servers to it.
To point Policy Servers to a centralized monitor

1. For each Policy Server that will point to the monitoring service, open the Policy Server Management Console.
   
   Important! If you are accessing this graphical user interface on Windows Server 2008, open the shortcut with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

2. In the Settings tab, under OneView Monitor, select Connect to Remote Monitor.

3. In the field below, enter the hostname and TCP port number of the system where the monitoring service is configured. For example:
   
   server.company.com:4444

4. Click OK to save your changes and close the Policy Server Management Console.

5. Restart the Policy Server.

More information:

Clustered Policy Servers (see page 105)
Chapter 14: Using the OneView Monitor

This section contains the following topics:

OneView Monitor Overview (see page 111)

OneView Monitor Overview

The SiteMinder OneView Monitor identifies performance bottlenecks and provides information about resource usage in a SiteMinder deployment. It also displays alerts when certain events, such as component failure, occur. It does this by collecting operational data from the following SiteMinder components:

- Policy Server
- SiteMinder Web Agent

As these components are added to a SiteMinder deployment, they are automatically registered with OneView Monitor. You do not need to configure OneView to monitor these components.

Each machine that hosts a monitored component includes a OneView agent. The agent sends operational data to the OneView Monitor, which resides on the machine where the Policy Server is installed. The OneView Monitor sends the operational data to a Web browser or (optionally) an SNMP agent. The SNMP agent sends the data to the SNMP manager.

OneView Monitor data can be accessed from a Web browser, or from a third-party SNMP monitoring application.
The following graphic illustrates how the OneView Monitor is integrated in a SiteMinder deployment.

The OneView Monitor collects properties, such as the IP address of the component’s host machine, and counters that reflect a component’s activity, such as how many times users have logged into your site. Counters are reset when the component is restarted.

Using the Web-based OneView viewer, administrators can define tables to view some or all of the data for a specific component. The data is refreshed at configurable intervals.

SNMP support enables monitoring applications to retrieve operational data from the OneView Monitor. SNMP support includes a Management Information Base (MIB) and an SNMP agent.

**Note:** In an environment that includes a clustered Policy Servers, you can specify a single OneView Monitor to monitor activity on all Policy Servers in a cluster. To configure a central monitor, you must adjust the OneView Monitor settings in the Policy Server Management Console for each Policy Server in the cluster.
More information:

Setting The Data Refresh Rate and Heartbeat (see page 122)
SNMP Monitoring (see page 129)

Policy Server Data

The following lists and describes Policy Server data:

**AgentTable**
Table of agents that are connected to this server.

*Note:* AgentTable is not available using SNMP.

**AuthAcceptCount**
Number of successful authentications.

**AuthRejectCount**
Number of failed authentication attempts. These attempts failed because of invalid credentials.

**AzAcceptCount**
Number of successful authorization attempts.

**AzRejectCount**
Number of rejected authorization attempts. These attempts were rejected because of insufficient access privileges.

**CacheFindCount**
Number of find operations in the authorization cache. Updated each time an authorization process asks whether a user belongs to a policy.

**CacheFindCount/sec**
Number of authorization cache find operations occurring per second.

**CacheHitCount**
Number of hits on the authorization cache. Updated each time the cache answers true when an authorization process asks whether a user belongs to a policy.

**CacheHitCount/sec**
Number of hits on the authorization cache occurring per second.

**CacheTTLMissCount**
Number of authorization cache misses because an element is found in the cache but considered too old.
Component Path

Path of the Policy Server, which uniquely identifies the server. The component path includes the following information:

- Host IP address
- Component type
- Component instance ID

**Note:** Component Path is not available using SNMP.

Crypto bits

Length of the encryption key used to encrypt/decrypt data sent between the Web Agent and the Policy Server.

HitRate

The ratio of authorization cache hits to authorization find operations. This is an indicator of authorization cache effectiveness.

Host

IP address of the machine where the authentication server is installed.

**Note:** The Host IP address is included in the Component Path.

IsProtectedCount

Number of IsProtected calls received from an Agent.

Label

Policy Server build number.

LastActivity

Date and time of the Policy Server’s last interaction with the Monitor.

MaxSockets

Maximum number of Web Agent sockets available to submit concurrent requests to a Policy Server.

MaxThreads

Maximum number of worker threads in the thread pool.

MaximumThreadsEverUser

Maximum number of worker threads from the thread pool ever used.

PriorityQueueLength

Number of entries in the priority queue. The priority queue holds entries of high priority. See ServerQueueLength.

Platform

Operating system of the machine where the Policy Server is installed.
**PolicyCacheEnabled**
Indicates whether the policy cache is enabled.

**Port**
Policy Server port number.

**Product**
Policy Server product name.

**ServerQueueLength**
Number of entries in the normal queue. The normal queue holds entries of normal priority. See PriorityQueueLength.

**SocketCount**
Number of open sockets, which corresponds to the number of open connections between the Policy Server and Web Agents.

**Status**
Status of the Policy Server. The status can be Active or Inactive.
Inactive status indicates that there was no interaction between the Policy Server and the monitor for a specified period of time. The period of time is determined by the heartbeat interval.

**ThreadsAvailable**
Number of a worker threads that are available from within the thread pool. All worker threads, which process requests, are organized into a thread pool. Not all threads are busy immediately--only when enough load is applied. This value shows how many threads are not currently busy.

**ThreadsInUse**
Number of worker threads from the thread pool that are in use.

**Time Zone**
Time zone for the geographical location where the Policy Server is installed.

**Type**
Type of Policy Server.

**Universal Coordinated Time**
The startup time of the Policy Server.

**UserAzCacheEnabled**
Indicates whether the user authorization cache is enabled.

**Update**
Version number of the most recently applied update.
Version

Version number of the Policy Server.

Web Agent Data

The following lists and describes Web Agent data:

AuthorizeAvgTime

Indicates the average time it takes to authorize a user (in milliseconds).

AuthorizeCount

Number of authorization attempts made by this Agent. An authorization attempt occurs when a user supplies credentials to the Policy Server in order to access a protected resource.

AuthorizeErrors

Number of errors that occurred during authorization attempts made by this Web Agent. An error indicates a communication failure between the Web Agent and Policy Server during an authorization call.

AuthorizeFailures

Number of failed authorization attempts. An authorization attempt fails when a user lacks sufficient privileges to access a resource.

BadCookieHitsCount

Number of cookies that the Web Agent could not decrypt.

BadURLcharsHits

Number of requests that the Agent refuses because of bad URL characters. Bad URL characters are specifically blocked to prevent a Web client from evading SiteMinder rules. These characters are specified in the Web Agent’s configuration.

Component Path

Path of the Web Agent. The component path includes the following information:

- Host IP address
- Component type
- Component instance ID

Note: Component Path is not available using SNMP.
CrosssiteScriptHits
Number of cross-site scripting hits. A cross-site scripting hit consists of malicious code embedded in pages at your site.

Note: For more information about cross-site scripting, see the Web Agent Configuration Guide.

Crypto bits
Length of the encryption key used to encrypt/decrypt data sent between the Web Agent and the Policy Server.

ExpiredCookieHitsCount
Number of requests that contained an expired cookie.

Host
IP address of the machine where the Web Agent is installed.

Note: The Host IP address is included in the Component Path.

IsProtectedAvgTime
The average amount of time it takes (in milliseconds) for the Web Agent to determine from the Policy Server whether or not a resource is protected.

IsProtectedCount
Number of times the Web Agent has checked the Policy Server to see if a resource is protected.

Note: If the resource cache is set to 0, the OneView Monitor may record two or more IsProtected calls per login attempt. If the Web Agent is not caching information, it must check with the Policy Server to determine whether or not a resource is protected each time a request is made to the Web server.

If the resource cache is not set to 0, the OneView Monitor only records one IsProtected call. In this case, the Web Agent makes one IsProtected call to the Policy Server; subsequent requests to the Web server for the same resource are satisfied against the Web Agent’s resource cache until the resource in the cache expires or the resource cache is flushed.

IsProtectedErrors
Number of times an error has occurred when the Web Agent asks the Policy Server whether or not a resource is protected. An error indicates a communication failure between the Web Agent and the Policy Server.

Label
Web Agent build number.

Last Activity
Date and time of the Web Agent’s last activity.
**LoginAvgTime**

Average time it takes for a user to log in.

**LoginCount**

Number of login attempts made from this Web Agent.

**LoginErrors**

Number of errors that occurred during login attempts. An error indicates a communication failure between the Web Agent and the Policy Server.

**LoginFailures**

Number of failed login attempts. Login failures occur when users supply invalid credentials.

**Name**

Name of the Web Agent.

**Platform**

Operating system of the machine where the Web Agent is installed.

**Product**

Web Agent product name.

**ResourceCacheCount**

Number of entries in the resource cache. The resource cache stores information about recently accessed resources to speed up subsequent requests for the same resource.

The number of entries in the resource cache can be 0 to \( n \), where \( n \) is the maximum cache size specified in the Web Agent’s configuration.

**ResourceCacheHits**

Number of times that the Web Agent located a resource in the resource cache. This number indicates how frequently SiteMinder is using cached resources.

**ResourceCacheMax**

The maximum number of entries the resource cache can contain. This number is specified in the Web Agent’s configuration.

**Note:** Details on setting the resource cache size exist in the *Web Agent Configuration Guide*.

**ResourceCacheMisses**

- The number of times the Web Agent could not locate a resource in the resource cache. This occurs when:
  - The resource has not been accessed before
  - The cached information has expired
SocketCount
Number of open sockets, which corresponds to the number of open connections between the Policy Server and the Web Agent.

Note: Because the Web Agent architecture has changed, SocketCount has no value.

Status
Status of the Web Agent. The status can be Active or Inactive.

Inactive status indicates that there was no interaction between the Web Agent and the monitor for a specified period of time. The period of time is determined by the heartbeat interval.

Time Zone
Time zone for the geographical location where the Web Agent is installed.

Type
Type of monitored component. In this case, the Web Agent.

Universal Coordinated Time
The startup time of the Web server where the Web Agent is installed.

Update
Version number of latest software update.
**UserSessionCacheCount**

Number of entries in the user session cache. The user session cache stores information about users who have recently accessed resources. Storing user information speeds up resource requests.

The number of entries in the user session cache can be 0 to \( n \), where \( n \) is the maximum cache size specified in the Web Agent’s configuration. See the *Web Agent Configuration Guide* for information on setting the user session cache size.

**Note:** The user session cache count may differ based on the Web server where the session cache is located.

For Web Agents that use multi-thread cache, such as IIS Web Agents, iPlanet 4.x and 6.0 Web Agents (on Windows operating systems), and Domino Web Agents (on Windows and UNIX operating systems), the OneView Monitor increases the user session cache count when a user is successfully authenticated and receives a session cookie from the Web Agent.

Apache and iPlanet 4.x and 6.0 Web Agents running on UNIX operating systems, which use multi-process cache, count sessions differently. A user’s session is not added to the session cache until he presents a session cookie to the Web Agent. The Web Agent creates a session cookie for the user after he is successfully authenticated. SiteMinder uses that cookie to authenticate the user if he makes additional resource requests. This means that the user’s first login is not recorded in the user session cache count. If the user makes another request and SiteMinder authenticates the user using the session cookie, the user session cache count increases.

In all Web Agents, the user session is valid for resources in one realm. If the user accesses a resource in a different realm using a session cookie, he is given another user session, which increases the user session cache count.

**UserSessionCacheHits**

Number of times that Web Agent accessed the user session cache.

**UserSessionCacheMax**

The maximum number of entries the user session cache can contain. This number is specified in the Web Agent’s configuration.

**Note:** Details on setting the user session cache size exist in the *Web Agent Configuration Guide*.

**UserSessionCacheMisses**

The number of times the Web Agent could not locate user session information in the user session cache. This occurs when:

- The user has not accessed a resource before
- The cached information has expired
ValidationAvgTime

Average amount of time it takes to validate a cookie used to authenticate a user (in milliseconds). Cookies may be used to authenticate a user in a single sign-on environment.

ValidationCount

The number of times a specific Web Agent attempted to validate a session cookie against the Policy Server to authenticate a user, instead of matching that user’s credentials to a user directory entry. (The Web Agent creates a session cookie on the user’s browser when a user is successfully authenticated, and uses that cookie to authenticate the user on subsequent requests for new resources.)

The following conditions affect the ValidationCount:

User Session Cache size

If a Web Agent’s user session cache is set to a value greater than 0, the user’s session information is stored in the cache. The Web Agent validates the session against the session cache instead of the Policy Server, so the ValidationCount does not increase. If the user session cache is set to 0, the ValidationCount increases each time a user requests a protected resource because the Web Agent must validate the session against the Policy Server.

Multi-thread vs. Multi-process cache

Web Agents that use multi-threaded cache, such as IIS Web Agents, iPlanet 4.x and 6.0 Web Agents (on Windows operating systems, and Domino Web Agents (on Windows and UNIX operating systems), add a session to the session cache (if the session cache size is greater than 0) when a user is successfully authenticated. If that user requests additional resources from the same realm, the Web Agent validates the user against the session cache, so the ValidationCount does not increase.

Apache and iPlanet 4.x and 6.0 Web Agents running on UNIX operating systems, which use multi-process cache, do not add the session cookie to the session cache until the user presents the cookie to the Web Agent during a request for another resource in the realm where she was authenticated. The Web Agent validates the first request made with a session cookie against the Policy Server, which increases the ValidationCount. Subsequent requests are validated against the cache.

ValidationErrors

The number of errors that occurred when the Web Agent attempted to validate a user session. Errors indicate a communication failure between the Web Agent and the Policy Server.
ValidationFailures

The number of times the Web Agent has failed to validate a user session because of an invalid session cookie.

Version

Version number of the Web Agent.

Configure the OneView Monitor

Configuring the OneView Monitor includes:
- Setting the data refresh rate and heartbeat
- Configuring port numbers

Setting The Data Refresh Rate and Heartbeat

You can change how often data is sent between the OneView Monitor and a monitored component by modifying the following settings:
- Refresh rate determines how often the OneView Monitor requests data from the authentication and authorization servers. The default refresh rate is 5 seconds.
- Heartbeat specifies how often monitored components send a heartbeat to the Monitor. For the authentication and authorization servers, the heartbeat indicates whether or not the component is active. For the Web Agent, the heartbeat determines how often the Monitor receives the Web Agent’s operational data. The default value is 30 seconds.

To modify the default values
2. Change the value paired with the following properties, as necessary:
   - Refresh rate: nete.mon.refreshPeriod
   - Heartbeat: nete.mon.hbPeriod

   Note: The value for these properties is specified in seconds.
3. Save and close mon.conf.
4. Restart the OneView Monitor.

More information:

Start and Stop Policy Server Services on Windows Systems (see page 24)
Start and Stop Policy Server Processes on UNIX Systems (see page 24)
Configuring Port Numbers

The One View Monitor uses the following default port numbers:

- OneView Agent--44449
- OneView Monitor--44450

To change the default port numbers

1. Open `Policy_Server_installation/config/conapi.conf`.
2. Change the port number paired with the following properties, as necessary:
   - OneView Agent: `nete.conapi.service.monagn.port`
   - OneView Monitor: `nete.conapi.service.mon.port`
3. Save and close `conapi.conf`.
   **Note:** For more information about the properties in `conapi.conf`, see the notes in the `conapi.conf` file.
4. Restart the OneView Monitor.

More information:

- [Start and Stop Policy Server Services on Windows Systems](#) (see page 24)
- [Start and Stop Policy Server Processes on UNIX Systems](#) (see page 24)

Clustered Environment Monitoring

In a non-clustered SiteMinder deployment, a Monitor process is located on the same system as the Policy Server. The Monitor user interface and the SNMP provide information for a single Policy Server. To monitor a cluster, the Policy Servers in the cluster must be configured to point to a single Monitor process. The Policy Server Management Console allows you to specify a Monitor process host.

Consider the following when implementing a monitoring in a clustered environment:

- The network channel between a Policy Server and a Monitor process is non-secure.
- If the Monitor process fails, all monitoring stops. If the Monitor host is disconnected, the monitoring stops.
- Monitoring through SNMP is supported for a cluster.

**Note:** By not enabling clustering, all servers are in the default cluster. Centralized monitoring can be enabled for non-clustered environments.
More information:

Point Clustered Policy Servers to the Centralized Monitor (see page 110)

Access the OneView Viewer

Be sure the OneView Monitor service is running before you access the OneView viewer.

To access the OneView viewer, enter the following URL in a browser:

http://your_server.your_company.org:port/sitemindermonitor

where your_server.your_company.org:port is the host name or IP address, and the port number of the Web server which is configured for the OneView Monitor.

Note: For instructions on configuring a Web server for the OneView Monitor, see the Policy Server Installation Guide.

Protect The OneView Viewer

To protect the OneView viewer, create a SiteMinder policy that protects the resources in sitemindermonitor.

View Monitored Components

OneView Monitor provides four default tables:

- All Components (displayed)
- Policy Servers
- Agents

The All Components table is displayed when you open OneView.

Note: A Web Agent installed on an Apache or iPlanet 6.0 Web server will not appear in the OneView viewer until that Web Agent asks the Policy Server if a resource is protected. When the Web Agent requests information from the Policy Server, it is registered with the OneView Monitor.

The OneView viewer displays operational data in configurable tables. A table may contain a Details column. Clicking an icon in the Details column opens a window that displays all the monitored data for a particular component.
How to Customize OneView Displays

Customizing OneView displays includes:

- **Setting up tables** (see page 125)
- **Configuring alerts** (see page 126)
- **Displaying tables** (see page 126)
- **Sorting tables** (see page 126)
- **Configuring data updates** (see page 126)
- **Saving settings** (see page 127)
- **Changing the default display** (see page 127)
- **Loading settings** (see page 127)

Set Up Tables

**To set up tables**

1. Click Configure.
   
   The Table Configuration dialog box opens.
2. Complete one of the following options:
   
   - Select Existing Table. Choose a table from the list box.
   - Select New Custom Table. Enter a name in the Table Name field.
3. Select components to display in the table.
4. Select the fields to display in the table. Specify the order in which the fields are displayed by selecting a field and using the up or down arrow to position the field. The available fields are determined by the type of component(s) selected for the table.
   
   **Note:** The value for some of the fields can be displayed as a continuously increasing number (reset when the component is restarted) or as an average since the last update period. To view the average value, select a field name with /sec appended to it.
5. Click OK.
   
   **Note:** Make sure to save the table after configuring it.

More information:

**Save Settings** (see page 127)
Configure Alerts

To configure alerts

1. Click Configure.
2. Click the Alerts tab.
3. Select a field from the left list box. This list box contains all of the fields in the currently loaded tables.
4. Select an operator from the middle list box.
5. Specify a value for the field that you selected in step 3.
6. Optionally, select Highlight the table cell to have OneView highlight the specified table cell when the specified criteria is met.
7. Optionally, select Pop up a warning message to have OneView display a pop-up window when the specified criteria is met.

Display Tables

To display tables, select a table from the View Table list box in the main viewer page. When you select a table from this list, OneView displays the selected table below the existing table.

To hide a table, click the Hide button.

Sort Tables

You can sort the data in each column in a table in ascending or descending order. Sorting columns helps organize a table. For example, sorting a table based on Status enables you to view all inactive components grouped together.

Note: An arrow in the column heading indicates which column is sorted.

Configure Data Updates

By default, OneView updates data every thirty seconds. You can:

- Modify the amount of time that passes between automatic updates
- Configure the OneView to update data only when you refresh the browser
To configure data updates

1. Click Updates.
   SiteMinder opens the Updates dialog box.

2. Select one of the following:
   - Live Updates--Updates the data after a specified period of time. Specify the time interval in seconds.
   - Manual Updates--Updates the data when a user refreshes the page.

3. Click OK.

Save Settings

Saving a setting saves:
- Table definitions
- Main page display
- Table sorting
- Update rate

To save settings

1. Click Save Settings.
   SiteMinder displays a dialog box where you can name the settings.

2. Enter a name in the text box.

3. Click OK.

Change the Default Display

To change the default display

1. Rename the defaults file in siteminder_installation\monitor\settings.

2. In the OneView Monitor console, configure the settings.

3. Save the settings as defaults.

Load Settings

To load settings

1. Click Load Settings.
   SiteMinder displays a dialog box where you can select settings to load.

2. Select a setting from the list box.

3. Click OK.
Chapter 15: Monitoring SiteMinder Using SNMP

This section contains the following topics:

- **SNMP Monitoring** (see page 129)
- **SiteMinder MIB** (see page 132)
- **Configure the SiteMinder Event Manager** (see page 141)
- **Start and Stop SiteMinder SNMP Support** (see page 143)
- **Troubleshooting the SiteMinder SNMP Module** (see page 144)

### SNMP Monitoring

The SiteMinder SNMP module enables many operational aspects of the SiteMinder environment to be monitored by SNMP-compliant network management applications.

### SNMP Overview

Network management takes place between two types of systems: those in control, called managing systems, and those observed and controlled, called managed systems. Managed systems can include hosts, servers, and the software components that run on those systems, or network components such as routers or intelligent repeaters.

To promote interoperability, cooperating systems adhere to the industry standard Simple Network Management Protocol (SNMP), an application-layer protocol designed to facilitate the exchange of management information between network devices.
A complete SNMP solution comprises three components:

- **SNMP Management Information Base (MIB)** is a database of managed objects. The managed objects, or variables, can be read by a managing system to provide information about the managed system.

- **SNMP Agents** are low-impact software modules that access information about the managed system and make it available to the managing system. For software systems, agent functionality is sometimes split between a master agent (provided by the host operating system) and subagent (provided by the managed application).

  **Note:** SNMP agents, which are a standard component of all SNMP implementations should not be confused with SiteMinder Agents.

- **SNMP Manager** is typically a Network Management System (NMS) application such as HP OpenView.

The SiteMinder SNMP module provides SNMP request handling and configurable event trapping for the SiteMinder environment. It does this by collecting operational data from the SiteMinder OneView Monitor and making it available in a MIB to third-party NMS applications that support the SNMP protocol (for example, HP OpenView).

  **Note:** The 6.0 SNMP agent is backwards compatible with all SiteMinder 5.x-based Agent applications.

### SiteMinder SNMP Module Contents

The SiteMinder SNMP module consists of:

- **SiteMinder SNMP MIB** is the database of SiteMinder objects that can be monitored by an SNMP-compliant network management system.

- **A SiteMinder SNMP Subagent** responds to SNMP requests (GET and GETNEXT only) passed to it from an SNMP master agent.

- **SiteMinder Event Manager** captures Policy Server events and, if configured to do so, generates SNMP traps (unsolicited messages sent by an SNMP agent to a SNMP NMS indicating that some event has occurred).

### More information:

- [SiteMinder MIB](#) (see page 132)
- [Configure the SiteMinder Event Manager](#) (see page 141)
- [Start and Stop SiteMinder SNMP Support](#) (see page 143)
Dependencies

The SiteMinder SNMP Module has the following dependencies:

- **SiteMinder OneView Monitor**—The SiteMinder SNMP Module obtains operational information from the OneView Monitor. OneView Monitor must also be configured and running on any Policy Server on which you want to run the SiteMinder SNMP Module.

- **SNMP Master Agent**—The SiteMinder SNMP Module does not provide an SNMP Master Agent. You will need to ensure that the SNMP Master Agent (Windows SNMP Service or Solstice Enterprise Master Agent) appropriate to the Operating System of the Policy Server on which you are running the SiteMinder SNMP Module is also installed and enabled.

SNMP Component Architecture and Dataflow

The following figure illustrates SNMP module dataflow:

![SNMP Component Architecture and Dataflow Diagram]
SiteMinder SNMP Dataflow:
1. The SNMP Master Agent receives SNMP requests from a management application.
2. The SNMP Master Agent forwards the SNMP request to the SNMP Subagent.
3. The SiteMinder SNMP Subagent retrieves the requested information from OneView Monitor.
4. The SiteMinder SNMP Subagent passes the retrieved information back to the SNMP Master Agent.
5. The SNMP Master Agent generates an SNMP response and sends it back to the requesting management application.

SiteMinder MIB

The SiteMinder MIB provides a SNMPv2-compliant data representation of all monitored components in the SiteMinder environment.

The SiteMinder MIB is supplied in an ASCII text file:

```
SiteMinder_Install_Directory/mibs/NetegritySNMP.mib.
```

MIB Overview

SNMP MIB structure is logically represented by an inverse tree hierarchy. MIBs for internet-related products such as SiteMinder are located under the ISO main branch of the MIB hierarchy.
The upper part of the ISO branch is shown in the following figure.

MIB branches, MIBs, and managed objects within MIBs are all identified by short text strings. Complete MIB hierarchies can be expressed notationally by concatenating branch and object identifiers, separating each entry with a period. For example, the private sub-branch of the internet entry shown above can be expressed as iso.org.dod.internet.private.
SiteMinder MIB Hierarchy

The SiteMinder MIB can be expressed as iso.org.dod.internet.private.enterprises.netegrity.products.siteminder.

Supported managed components represented by MIB objects are Policy Servers and Web Agents. Because there can be multiple instances of each of these components, the managed properties of each of these components are columnar objects.

The SiteMinder MIB has three sub-branches:

**Policy Server**
- Contains the Policy Server (policyServerTable) objects.

**agents**
- Contains Web Agent (webAgent) objects.

**smEvent**
- Contains SNMP trap types for system events.

MIB Object Reference

The following sections contain detailed lists of the Policy Server, Web Agent, and Event MIB objects.
## Authentication Server Data

The following table contains the subset of Authentication Server properties that are exposed as objects in the SiteMinder MIB, which are under `iso.org...siteminder.policyServer.policyServerTable`.

<table>
<thead>
<tr>
<th>Object Name</th>
<th>SNMP Type</th>
<th>Object Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policyServerIndex</td>
<td>Integer32</td>
<td>A unique identifier for the current Policy Server instance.</td>
</tr>
<tr>
<td>policyServerHostID</td>
<td>IP address</td>
<td>IP address of the machine where the Policy Server is installed.</td>
</tr>
<tr>
<td>policyServerType</td>
<td>Display string</td>
<td>Type of component.</td>
</tr>
<tr>
<td>policyServerStatus</td>
<td>Integer32</td>
<td>Status of the Policy Server. The status can be Active or Inactive.</td>
</tr>
<tr>
<td>policyServerPort</td>
<td>Integer32</td>
<td>Policy Server port number.</td>
</tr>
<tr>
<td>policyServerProduct</td>
<td>Display string</td>
<td>Policy Server product name.</td>
</tr>
<tr>
<td>policyServerPlatform</td>
<td>Display string</td>
<td>Operating system of the machine where the Policy Server is installed.</td>
</tr>
<tr>
<td>policyServerVersion</td>
<td>Display string</td>
<td>Version number of the Policy Server.</td>
</tr>
<tr>
<td>policyServerUpdate</td>
<td>Display string</td>
<td>Version number of the most recently applied update.</td>
</tr>
<tr>
<td>policyServerLabel</td>
<td>Display string</td>
<td>Policy Server build number.</td>
</tr>
<tr>
<td>policyServerCrypto</td>
<td>Integer32</td>
<td>Length of the encryption key used to encrypt/decrypt data sent between the Web Agent and the Policy Server.</td>
</tr>
<tr>
<td>policyServerUTC</td>
<td>Display string</td>
<td>The startup time of the Web server where the Policy Server is installed. The time is specified in Universal Coordinated Time format.</td>
</tr>
<tr>
<td>policyServerTimeZone</td>
<td>Integer32</td>
<td>Time zone for the geographical location where the Policy Server is installed.</td>
</tr>
<tr>
<td>policyServerMaxSockets</td>
<td>Integer32</td>
<td>Maximum number of open sockets (which correspond to the number of open connections between the Policy Server and Web Agents) that the Policy Server can support.</td>
</tr>
<tr>
<td>policyServerSocketCount</td>
<td>Gauge32</td>
<td>Number of open sockets, which corresponds to the number of open connections between the Policy Server and Web Agents.</td>
</tr>
<tr>
<td>policyServerAuthAcceptCount</td>
<td>Counter32</td>
<td>Number of successful authentications.</td>
</tr>
</tbody>
</table>
### SiteMinder MIB

#### Object Name | SNMP Type | Object Description
--- | --- | ---
policyServerAuthReject-Count | Counter32 | Number of failed authentication attempts. These attempts failed because of invalid credentials.
policyServerAzAccept-Count | Counter32 | Number of successful authorizations.
policyServerAzReject-Count | Counter32 | Number of failed authorization attempts. These attempts failed because of invalid credentials.
policyServerPolicy-Cache Enabled | Truth Value | Indicates whether or not policy cache is enabled.
policyServerL2Cache-Enabled | Truth Value | Indicates whether or not L2 cache is enabled.

### Web Agent Objects in the SiteMinder MIB

The following table contains the Web Agent properties that are exposed as objects in the SiteMinder MIB, which are under iso.org...siteminder.webAgentTable.webAgentEntry.

#### Object Name | SNMP Type | Object Description
--- | --- | ---
webAgentIndex | Integer32 | A unique identifier for the current Web Agent instance.
webAgentHostID | IP address | IP address of the machine where the web agent server is installed.
webAgentType | Display string | Type of component.
webAgentStatus | Integer32 | Status of the Web Agent. The status can be Active or Inactive.
webAgentPort | Integer32 | Web Agent port number.
webAgentProduct | Display string | Web Agent product name.
webAgentPlatform | Display string | Operating system of the machine where the Web Agent is installed.
webAgentVersion | Display string | Version number of the Web Agent.
webAgentUpdate | Display string | Version number of the most recently applied update.
webAgentLabel | Display string | Web Agent build number.
webAgentCrypto | Integer32 | Length of the encryption key used to encrypt/decrypt data sent between the Web Agent and the Policy Server.
<table>
<thead>
<tr>
<th><strong>Object Name</strong></th>
<th><strong>SNMP Type</strong></th>
<th><strong>Object Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>webAgentUTC</td>
<td>Display string</td>
<td>The startup time of the Web server where the Web Agent is installed. The time is specified in Universal Coordinated Time format.</td>
</tr>
<tr>
<td>webAgentTimeZone</td>
<td>Integer32</td>
<td>Time zone for the geographical location where the Web Agent is installed.</td>
</tr>
</tbody>
</table>
| webAgentSocketCount             | Gauge32       | Number of open sockets, which corresponds to the number of open connections between the Policy Server and the Web Agent.  
**Note:** Because the Web Agent architecture has changed, SocketCount has no value. |
| webAgentResource-CacheCount     | Integer32     | Number of entries in the resource cache. The resource cache stores information about recently accessed resources to speed up subsequent requests for the same resource.  
The number of entries in the resource cache can be 0 to the \( n \), where \( n \) is the maximum cache size specified in the Web Agent’s configuration. |
| webAgentResource-CacheHits      | Integer32     | Number of times that the resource cache is accessed. This number indicates how frequently SiteMinder is using cached resources.                        |
| webAgentResource-CacheMisses    | Integer32     | The number of times the Web Agent could not locate a resource in the resource cache. This occurs when:  
- The resource has not been accessed before.  
- The cached information has expired. |
| webAgentUserSession-CacheCount  | Integer32     | Number of entries in the user session cache. The user session cache stores information about users who have recently accessed resources. Storing user information speeds up resource requests.  
The number of entries in the user session cache can be 0 to \( n \), where \( n \) is the maximum cache size specified in the Web Agent’s configuration.  
**Note:** The user session cache count may differ based on the Web server where the session cache is located. |
<p>| webAgentUserSession-CacheHits   | Integer32     | Number of times that Web Agent accessed the user session cache.                                                                                              |</p>
<table>
<thead>
<tr>
<th>Object Name</th>
<th>SNMP Type</th>
<th>Object Description</th>
</tr>
</thead>
</table>
| webAgentUserSession-CacheMisses | Integer32 | The number of times the Web Agent could not locate user session information in the user session cache. This occurs when:  
  - The user has not accessed a resource before.  
  - The cached information has expired. |
| webAgentIsProtected-Count | Integer32 | Number of times the Web Agent has checked the Policy Server to see if a resource is protected.  
**Note:** If the resource cache is set to 0, two or more IsProtected calls may be recorded per login attempt. If the Web Agent is not caching information, it must check with the Policy Server to determine whether or not a resource is protected each time a request is made to the Web server.  
If the resource cache is not set to 0, only one IsProtected call will be recorded. In this case, the Web Agent makes one IsProtected call to the Policy Server; subsequent requests to the Web server for the same resource are satisfied against the Web Agent's resource cache until the resource in the cache expires or the resource cache is flushed. |
<p>| webAgentIsProtected-Errors | Integer32 | Number of times an error has occurred when the Web Agent asks the Policy Server whether or not a resource is protected. An error indicates a communication failure between the Web Agent and the Policy Server. |
| webAgentIsProtected-AvgTime | Unsigned 32 | The average amount of time it takes for the Web Agent to determine from the Policy Server whether or not a resource is protected. |
| webAgentLoginCount       | Counter 32 | Number of login attempts made from this Web Agent.                                                                                                  |
| webAgentLoginErrors      | Counter 32 | Number of errors that occurred during login attempts. An error indicates a communication failure between the Web Agent and the Policy Server.          |
| webAgentLoginFailures    | Counter 32 | Number of failed login attempts because users were not authenticated or authorized by the Policy Server.                                               |
| webAgentLoginAvgTime     | Unsigned 32 | Average time it takes for a user to log into a resource.                                                                                           |</p>
<table>
<thead>
<tr>
<th>Object Name</th>
<th>SNMP Type</th>
<th>Object Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>webAgentValidation-Count</td>
<td>Counter 32</td>
<td>The number of times a specific Web Agent attempted to validate a session cookie against the Policy Server to authenticate a user, instead of matching that user’s credentials to a user directory entry. (The Web Agent creates a session cookie on the user’s browser when a user is successfully authenticated, and uses that cookie to authenticate the user on subsequent requests for new resources.).</td>
</tr>
<tr>
<td>webAgentValidation-Errors</td>
<td>Counter 32</td>
<td>The number of errors that have occurred when the Web Agent attempted to validate a user session. Errors indicate a communication failure between the Web Agent and the Policy Server.</td>
</tr>
<tr>
<td>webAgentValidation-Failures</td>
<td>Counter 32</td>
<td>The number of times the Web Agent has failed to validate a user session because of an invalid session cookie.</td>
</tr>
<tr>
<td>webAgentValidation-AvgTime</td>
<td>Unsigned 32</td>
<td>Average amount of time it takes to validate a cookie used to authenticate a user (in milliseconds). Cookies may be used to authenticate a user in a single sign-on environment.</td>
</tr>
<tr>
<td>webAgentAuthorize-Count</td>
<td>Counter 32</td>
<td>Number of authorization attempts made by this Agent. An authorization attempt occurs when a user supplies credentials to the Policy Server in order to access a protected resource.</td>
</tr>
<tr>
<td>webAgentAuthorize-Errors</td>
<td>Counter 32</td>
<td>Number of errors that occurred during authorization attempts made by this Web Agent. An error indicates a communication failure between the Web Agent and Policy Server during an authorization call.</td>
</tr>
<tr>
<td>webAgentAuthorize-Failures</td>
<td>Counter 32</td>
<td>Number of failed authorization attempts. An authorization attempt fails when a user enters invalid credentials.</td>
</tr>
<tr>
<td>webAgentAuthorize-AvgTime</td>
<td>Integer 32</td>
<td>Indicates the average time it takes to authorize a user (in milliseconds)</td>
</tr>
<tr>
<td>webAgentCrosssite-ScripHits</td>
<td>Integer 32</td>
<td>Number of cross-site scripting hits. A cross-site scripting hit consists of malicious code embedded in pages at your site. For more information about cross-site scripting, see the SiteMinder Web Agent Configuration Guide.</td>
</tr>
<tr>
<td>webAgentBadURL-chars Hits</td>
<td>Integer 32</td>
<td>Number of requests that the Agent refuses because of bad URL characters. Bad URL characters are specifically blocked to prevent a Web client from evading SiteMinder rules. These characters are specified in the Web Agent’s configuration.</td>
</tr>
</tbody>
</table>
### Object Name

<table>
<thead>
<tr>
<th>Object Name</th>
<th>SNMP Type</th>
<th>Object Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>webAgentBadCookie-HitsCount</td>
<td>Gauge32</td>
<td>Number of cookies that the Web Agent could not decrypt.</td>
</tr>
<tr>
<td>webAgentExpired-CookieHitsCount</td>
<td>Gauge32</td>
<td>Number of requests that contained an expired cookie.</td>
</tr>
</tbody>
</table>

### Event Data

The following table contains the objects in the SiteMinder MIB, under iso.org...siteminder.smEvents, for system events that can be mapped to SNMP traps using the SiteMinder Event Manager

<table>
<thead>
<tr>
<th>Event Name</th>
<th>Event ID</th>
<th>Event Category</th>
<th>Event Category Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>serverInit</td>
<td>SmLogSystemEvent_ServerInit</td>
<td>Server activity</td>
<td>System</td>
</tr>
<tr>
<td>serverUp</td>
<td>SmLogSystemEvent_ServerUP</td>
<td></td>
<td></td>
</tr>
<tr>
<td>serverDown</td>
<td>SmLogSystemEvent_ServerDown</td>
<td></td>
<td></td>
</tr>
<tr>
<td>serverInitFail</td>
<td>SmLogSystemEvent_ServerInitFail</td>
<td></td>
<td></td>
</tr>
<tr>
<td>dbConnectionFailed</td>
<td>SmLogSystemEvent_DbConnectFail</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ldapConnectionFailed</td>
<td>SmLogSystemEvent_LDAP-ConnectFail</td>
<td></td>
<td></td>
</tr>
<tr>
<td>logFileOpenFail</td>
<td>SmLogSystemEvent_LogFile-OpenFail</td>
<td>System Activity</td>

</tr>
<tr>
<td>authReject</td>
<td>SmLogAccessEvent_AuthReject</td>
<td>Authentication</td>
<td>Access</td>
</tr>
<tr>
<td>validateReject</td>
<td>SmLogAccessEvent_ValidateReject</td>
<td></td>
<td></td>
</tr>
<tr>
<td>azReject</td>
<td>SmLogAccessEvent_AzReject</td>
<td>Authorization</td>
<td></td>
</tr>
</tbody>
</table>
## Configure the SiteMinder Event Manager

The Event Manager application (supplied as a library file, EventSNMP.dll) that captures Policy Server events, determines whether SNMP traps are to be generated for those events (as specified by a configuration file) and if so, generates SNMP traps to specified NMS(s).

You configure the SiteMinder Event Manager by defining the Event Configuration File (`SM_Install_Directory\config\snmptrap.conf`), which defines what events are to be processed and the addresses of the NMSs to which the traps should be sent.

### Event Configuration File Syntax

The snmptrap.conf is an editable ASCII file, with a simple one line per event syntax:

```
Event_Name Destination_Address
```

**Event_Name**

The name of a MIB event object (or a comma-separated group of names of event objects).

Examples:

- serverUP
- serverUp,serverDown
- serverUp,serverDown,serverInitFail

---

<table>
<thead>
<tr>
<th>Event Name</th>
<th>Event ID</th>
<th>Event Category</th>
<th>Event Category Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>adminReject</td>
<td>SmLogAccessEvent_AdminReject</td>
<td>Administration</td>
<td></td>
</tr>
<tr>
<td>objectLoginReject</td>
<td>SmLogObjEvent_LoginReject</td>
<td>Authentication</td>
<td>Object</td>
</tr>
<tr>
<td>objectFailedLogin</td>
<td>SmLogObjEvent_FailedLogin-AttemptsCount</td>
<td>DirectorySession</td>
<td>EMS</td>
</tr>
<tr>
<td>emsLoginFailed</td>
<td>SmLogEmsEvent_LoginFail</td>
<td></td>
<td></td>
</tr>
<tr>
<td>emsAuthFailed</td>
<td>SmLogEmsAuthFail</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Destination_Address

The address of an NMS (or a comma-separated group of the addresses of NMSs) to which generated traps should be sent. Each address should be of the form: HostID:port:community

HostID

(mandatory) Either a hostname or IP address.

Port

(optional) IP port number.

Default: 162.

Community

(optional) An SNMP community. Note that if community is specified, Port must also be specified.

Default: "public"

Example: 100.132.5.166

Example: 100.132.5.166:162

Example: victoria:162:public

Note: Be careful to avoid event duplication. That is, you should avoid putting the same event in multiple entries. Also, comment lines can be added lines, prefixed with a "#" character.

Event Configuration File Examples

ServerDown,serverUp 111.123.0.234:567:public

This entry configures the Event Manager to send serverDown and serverUp SNMP traps to the NMS at IP address 111.123.0.234, port 567, community public.

agentConnectionFailed 111.123.0.234,victoria

This entry configures the Event Manager to send SNMP traps of agentConnectionFailed type will be sent to IP address 111.123.0.234, port 567, community public and to host “victoria”, port 567, community public.

azReject

This entry configures the Event Manager to discard all events of the azReject type so that no traps are sent.
Start and Stop SiteMinder SNMP Support

If you chose to install SiteMinder SNMP support when you installed the Policy Server, the SiteMinder SNMP Agent service should start automatically whenever the Policy Server initializes.

This section describes how to manually start and stop the SiteMinder SNMP subagent on Windows and UNIX Policy Servers.

Start and Stop the Windows Netegrity SNMP Agent Service

To start the SiteMinder SNMP subagent on Windows Policy Servers
1. Open the Services control panel:
   - (Windows NT) Start, Settings, Control Panels, Services.
2. Select the Netegrity SNMP Agent service.
3. Click Start.
   **Note:** When you restart the Windows SNMP service, also manually restart the Netegrity SNMP Agent service.

To stop the SiteMinder SNMP subagent on Windows Policy Servers
1. Open the Services control panel:
   - (Windows NT) Start, Settings, Control Panels, Services.
2. Select the Netegrity SNMP Agent service.
3. Click Stop.
   **Note:** If you stop the Windows SNMP service, the Netegrity SNMP Agent service is not generally available, but can then be accessed through port 801.
Start and Stop SNMP support on UNIX Policy Servers

On UNIX Policy Servers, the SiteMinder service can only be started or stopped by starting or stopping the Sun Solstice Enterprise Master agent (snmpdx) daemon.

To start the Netegrity SNMP Agent service on UNIX Policy Servers
1. Login as super user (root)
2. Type cd /etc/rc3.d
3. Type sh SXXsnmpdx (S76snmpdx) start

To stop the Netegrity SNMP Agent service on UNIX Policy Servers
1. Login as super user (root)
2. Type cd /etc/rc3.d
3. Type sh SXXsnmpdx (S76snmpdx) stop

Note: Stopping the Sun Solstice Enterprise Master agent operation will disable all SNMP services on the UNIX host.

Troubleshooting the SiteMinder SNMP Module

This section provides some advice and describes some tools that SiteMinder provides to help you isolate the point of failure if you have trouble establishing a management connection to, or receiving SNMP traps from SiteMinder.

SNMP Traps Not Received After Event

Symptom:
I am not receiving SNMP traps when events that should have generated them occur.

Solution:
1. Check network connectivity between the NMS and monitored Policy Server.
2. Check that the SiteMinder SNMP subagent and SNMP master agent are running on the Policy Server.
3. Enable trap logging by setting the NETE_SNMPLOG_ENABLED system environment variable.
SiteMinder generates the following log files in sminstalldir/log:

**Windows:**
- SmServAuth_snmptrap.log
- SmServAz_snmptrap.log
- SmServAcct_snmptrap.log
- SmServAdm_snmptrap.log

**UNIX:**
- smservauth_snmptrap.log
- smservaz_snmptrap.log
- smservacct_snmptrap.log
- smservadm_snmptrap.log

**Important!** The log files generated can grow very rapidly. You should disable trap logging and delete the file as soon as you have resolved your trap receipt issues.
Chapter 16: SiteMinder Reports

This section contains the following topics:

- Report Descriptions (see page 147)
- Schedule a SiteMinder Report (see page 148)
- View SiteMinder Reports (see page 149)
- Delete SiteMinder Reports (see page 150)
- Recurring Reports (see page 150)

Report Descriptions

SiteMinder reports are organized into two groups:

- Audit reports
- Analysis reports

Audit reports are created from existing audit capabilities of the Policy Server. The Policy Server must be configured to write to a database.

Analysis reports are based on run-time policy evaluation, for example, evaluating which users can perform what tasks.

You can generate the following reports using the SiteMinder Administrative UI:

**Activity By User**
- Lists activities of all users during the specified time period.

**Administrative Operations by Administrator**
- Lists all administrative operations in the policy store by administrator.

**Applications**
- Lists all configured applications that the user is authorized to use.

**Applications by User**
- Lists all users for a given set of applications.

**Denied Authorizations**
- Lists all denied authorizations.

**Denied Resources**
- Lists all denials of requested resources.

**Policies by Role**
- Lists all policies for a specified set of roles in an application.
Protected Resources
Lists all protected resources (realm + rule filter).

Resource Activity
Lists all authentication and authorization activity by resource.

Resources by User
Lists all resources for a specified set of users.

Roles by Application
Lists all roles defined for each specified application.

Roles by Resource
Lists all roles defined for a specified resource.

Users by Resource
Lists all users associated with each specified resource.

Users by Role
Lists all users that belong to a specified role.

Schedule a SiteMinder Report

You can schedule a SiteMinder audit or analysis report on the Reports tab in the Administrative UI.

To schedule a SiteMinder report
1. Click the Reports tab and either Audit or Analysis.
2. Select the report you want to run.
3. Fill in all the required parameters. These will vary from report to report.
4. Click Next.
5. Select one of the following options from the drop-down list:
   - **Now**
     The report is run now.
   - **Once**
     The report is run only once.
   - **Hourly**
     The report runs repeatedly at the specified hourly interval.
   - **Daily**
     The report runs repeatedly at the specified daily interval.
Weekly
The report is run weekly on the specified day or days.

Monthly
The report is run repeatedly at the specified monthly interval.

Nth Day of the Month
The report is run repeatedly on the specified day of the month.

First Monday
The report is run on the first Monday of the month.

Last Day
The report is run on the last day of the month.

Xth Day of the Nth Week of the Month
The report is run on the specified day and week of the month.

6. Enter a description.
7. Click Submit.

View SiteMinder Reports

On the Reports tab in the Administrative UI, you can view any SiteMinder report whose status is Complete. If the status is Failed, you can view the status details.

To view SiteMinder reports
1. Click Reports, General, View SiteMinder Reports.
   The SiteMinder Report Search pane appears.
2. Click the radio button for the report you want to view. Note that the Status field must indicate that the report has completed.
3. Click Select.
   The report is displayed on the screen.
4. (Optional) Click the file icon if you want to save the report to a file. Select the output file format from the drop-down list.
5. (Optional) Click the printer icon to print the report.
6. (Optional) You can page through the report or enter a search string.
7. Click Close when you are finished viewing the report.
Delete SiteMinder Reports

You can delete one or more SiteMinder reports on the Reports tab of the Administrative UI.

**To delete SiteMinder reports**
1. Click Reports, General, Delete SiteMinder Reports.
   The Delete SiteMinder Reports pane opens.
2. Search for SiteMinder reports to delete by Report Name or Description or search for all SiteMinder reports.
3. Select one or more or all SiteMinder reports to delete, and click Submit.

The Delete SiteMinder Reports task is submitted for processing.

Recurring Reports

The Recurring Reports feature allows you to manage SiteMinder reports that have been scheduled to run more than once. This feature allows you to perform the following tasks:

**Delete Recurring Reports**
Delete one or more recurring SiteMinder reports.

**Modify Recurring Reports**
Modify the schedule of the selected recurring SiteMinder report.

**View Recurring Reports**
View the schedule of the selected recurring SiteMinder report.

Delete Recurring Reports

You can delete one or more recurring SiteMinder reports on the Reports tab of the Administrative UI.

**To delete recurring reports**
1. Click Reports, General, Recurring Reports, Delete Recurring Reports.
   The Delete Recurring Reports pane opens.
2. Search for recurring reports to delete by Report Name or Description or search for all recurring reports.

3. Select one or more or all recurring reports to delete, click Delete, and click OK.
   The Delete Recurring Reports task is submitted for processing.

**Modify Recurring Reports**

You can modify the schedule of a recurring SiteMinder report on the Reports tab of the Administrative UI.

**To modify recurring reports**

1. Click Reports, General, Recurring Reports, Modify Recurring Reports.
   The Modify Recurring Reports pane opens.

2. Search for a recurring report to modify by Report Name or Description or Search for all recurring reports.

3. Select one recurring report to modify, and click OK.
   The Schedule Type, Details, and Start and End Times are displayed for the selected recurring report.

4. Modify the schedule for the recurring report, and click Submit.
   The Modify Recurring Reports task is submitted for processing.

**View Recurring Reports**

You can view the schedule of a recurring SiteMinder report on the Reports tab of the Administrative UI.

**To view recurring reports**

1. Click Reports, General, Recurring Reports, View Recurring Reports.
   The View Recurring Reports pane opens.

2. Search for a recurring report to view by Report Name or Description or Search for all recurring reports.

3. Select one recurring report to view, and click OK.
   Scheduling information is displayed for the selected recurring report.

4. Click Close.
   The View Recurring Reports pane closes.
Chapter 17: Policy Server Tools

This section contains the following topics:

Policy Server Tools Overview (see page 153)
Export Policy Data Using smobjexport (see page 156)
Import Policy Data Using smobjimport (see page 160)
Overview of the XML-based Data Format (see page 163)
Export Policy Data Using XPSExport (see page 164)
Import Policy Data Using XPSImport (see page 172)
Export and Import Stored Keys (see page 174)
Manage an LDAP Policy Store Using smldapsetup (see page 176)
Delete SiteMinder Data in ODBC Databases (see page 185)
Check Solaris Patches with smpatchcheck (see page 186)
Import Tokens Using the SiteMinder Token Tool (see page 187)
SiteMinder Test Tool (see page 188)
Change the SiteMinder Super User Password Using smreg (see page 188)
How to Count the Users in your SiteMinder Environment (see page 189)
XPSConfig—Manage Product Parameters (see page 192)
XPSEvaluate—Evaluate Expressions (see page 196)
XPSExplorer—Browse Policy Store Data (see page 198)
XPSSecurity—Manage XPS Administrators (see page 206)
XPSSweeper—Synchronize XPS and SiteMinder Policy Stores (see page 209)

Policy Server Tools Overview

SiteMinder provides a number of administrative tools to help manage your SiteMinder environment. The list following describes the function of each tool.

smobjexport

Contains arguments that let you export an entire policy store; a specified policy domain; the specified policy domain and all system objects used by the policy domain, such as administrators, Agents, authentication schemes and user directories; Agent keys stored in the policy store along with the rest of the policy store data. By default, keys are not included in the export; only the Agent keys stored in the policy store; variables only.

smobjimport

Imports policy data into the SiteMinder policy store.

smkeyexport

Exports keys from the key store.

smkeyimport

Imports keys into the key store.
**smldapsetup**
Manages the SiteMinder policy store in an LDAP directory.

**ODBC database SQL scripts**
Removes SiteMinder policy store, token data, and log schema from ODBC databases.

**smpatchcheck**
Checks to make sure all of the required/recommended patches are installed on your Solaris machine.

**smreadclog**
Reads RADIUS log files generated by the Policy Server.

**SiteMinder Token Tool**
Preloads information about hardware tokens.

**smreg**
Lets you change the SiteMinder Super User password.
In addition, SiteMinder provides tools for working with policy data. The following list provides an overview of the XPS-family of tools. XPS tools are platform-independent command-line utilities that XPS administrators can use to manage policy store data. To learn about the options for a particular tool, enter the tool name followed by the -? parameter at the command line.

**XPSConfig**

Manages configuration data including vendors, products, and product parameters.

**Note:** To use XPSConfig, you must be an administrator with XPSConfig rights.

**XPSEvaluate**

Evaluates expressions and allows you to test performance.

**Note:** To use XPSEvaluate, you must be an administrator with XPSEvaluate rights.

**XPSExplorer**

Manages policy data including vendors, products, and applications.

**Note:** To use XPSExplorer, you must be an administrator with XPSExplorer rights.

**XPSExport**

Exports data from an XPS data store.

**XPSImport**

Imports data to an XPS data store.

**XPSSecurity**

Allows interactive creation and editing of XPS Administrators and their rights. To use this tool, copy it from either \win32\tools or /solaris/tools from the SiteMinder installation file (that you downloaded from CA) to the policy_server_home\bin directory.

**policy_server_home**

Specifies the Policy Server installation path.

**Important!** After you use XPSSecurity, delete it from policy_server_home\bin to prevent unauthorized use.

**Note:** To use XPSSecurity, you must be an administrator with XPSSecurity rights.

**XPSSweeper**

Synchronizes XPS and SiteMinder policy stores.

**Note:** To use XPSSweeper, you must be an administrator. No additional rights are required.
More information:

Reschedule SiteMinder Policy Data Synchronization (see page 45)

Requirement When Using the Policy Server Tools on Linux Red Hat

For the Policy Server tools (smreg, smobjimport, smobjexport) to work correctly on a Linux Red Hat operating system, you must define the Policy Server host name in /etc/hosts. The host name must be defined in this location because these utilities generate adminoids and OIDs. The operating system uses the gethostid() and gettimeofday() Linux functions when generating these OIDs.

Export Policy Data Using smobjexport

The smobjexport tool exports the entire policy store or a single policy domain by creating two files: an .smdif (SiteMinder Data Interchange Format) and a .cfg (environment configuration) file. The .smdif file standardizes SiteMinder data so you can import it to a different type of policy store. For example, you can export an .smdif file from an ODBC database and import it to an LDAP directory.

The environment configuration (.cfg) file contains environment-specific properties for the policy store such as IP Addresses, redirection URLs, shared secrets, agent names, logging settings, and .com extensions. Tabs separate the text in the .cfg file, and you can edit it as a tab-delimited file in any text editor or Microsoft Excel.

**Note:** Using the Command Line Interface, you can write Perl scripts to import and export particular objects rather than all the Policy Store objects. For more information, see the API Reference Guide for Perl.

The following table describes the four fields of a sample registration scheme entry from the .cfg file.

<table>
<thead>
<tr>
<th>Object OID</th>
<th>Object Class</th>
<th>Property Type</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;reg scheme OID&gt;</td>
<td>SelfReg</td>
<td>RegistrationURL</td>
<td><a href="http://your.url.com">http://your.url.com</a></td>
</tr>
</tbody>
</table>

The Object OID column is represented only by the OID variable since OIDs such as the following are too long to fit:

`reg_scheme_OID = 0d-6dc75be0-1935-11d3-95cc-00c04f7468ef`

Each entry's fields--Object OID, Object Class, Property Type, Value--can be edited in a text editor or Excel.
Note: For backward compatibility, the smobjexport command line only references the .smdif file. As a result, the corresponding environment configuration file is created according to the following naming convention: if the output file you specify with the smobjexport command has an .smdif extension (for example, file_name.smdif), then the extension is replaced with .cfg (such as file_name.cfg) for the configuration file. However, if the output file you specify does not have an .smdif extension (for example, file_name.txt), then .cfg is appended to file name and extension (such as file_name.txt.cfg).

smobjexport uses the following arguments to supply information required to export the data:

- **ofile_name**
  Specifies the path and file name of the output .smdif file. If this argument is not specified, the default output file names are stdout.smdif and stdout.cfg. This filename should be a name other than the one used for smldapsetup ldgen -file_name, otherwise the export will be overwritten.

- **f**
  Overwrites an existing output file.

- **sdomain-name**
  Exports only the specified policy domain.

- **edomain-name**
  Exports the specified policy domain and all system objects used by the policy domain, such as administrators, Agents, authentication schemes, and user directories, including the following:
  - If one of the system objects is a Host Configuration object, all Host Configuration objects are exported.
  - If one of the system objects is an Agent Configuration object, all Agent Configuration Objects are exported.
  - If one of the system objects is an affiliate (when the Policy Server Option Pack is installed), the entire domain to which the affiliate belongs is exported.

- **c**
  Exports sensitive data as clear-text. Exporting data as clear-text allows you to migrate policy data from a SiteMinder deployment that uses one encryption key to another SiteMinder deployment that uses a different encryption key. To use -c, you must enter the credentials of a SiteMinder administrator who can manage all SiteMinder domain objects. Enter credentials using the -d and -w arguments.

- **cb**
  Exports sensitive data encrypted with backward-compatible cryptography.
-cf
Exports sensitive data encrypted with FIPS-140 compatible cryptography.

-dadmin-name
Specifies the login name of a SiteMinder Administrator that can manage all SiteMinder objects in the policy store being exported.

-wadmin-pw
Specifies the password of the SiteMinder Administrator specified using -d.

-k
Exports Agent keys stored in the policy store along with the rest of the policy store data. By default, keys are not included in the export.

-x
Exports only the Agent keys stored in the policy store.

-v
Enables verbose mode.

-t
Enables low level tracing mode. This mode can be used to troubleshoot the export process.

-u
Export variables only.

-l
Creates a log file. Make sure the file_name.smdif file ends with an .smdif and not a .txt or other extension. If the file_name.smdif file ends with an .smdif extension, smobjexport creates a log file with a .log extension. However, if the file_name.smdif file ends with a .txt extension, smobjexport creates a file_name.txt.log file, which is incorrect since the log file must be in the file_name.log format.

-m
Exports IdentityMinder objects only.

-i
Exports specific IdentityMinder objects and all relevant system objects.

-j
Exports a specific IdentityMinder directory and all relevant system objects.

-?
Displays the help message.
Note: If the arguments contain spaces, use double quotes around the entire argument. For example, if the name of the SiteMinder administrator is SiteMinder Admin, the argument for smobjexport would be -d" SiteMinder Admin"

To export data using smobjexport

1. Navigate to one of the following locations:
   ■ On Windows, SiteMinder\installation\bin
   ■ On UNIX, SiteMinder\installation/bin

   siteminder_installation
   Specifies the installed location of SiteMinder.

2. Enter the following command:

   smobjexport -o file_name.smdif -c -d admin-name -w admin-password -v -t

   file-name
   Specifies the name of the .smdif output file that will contain the exported policy store data

   admin-name
   Specifies the name of a SiteMinder administrator that can manage all SiteMinder objects

   admin-password
   Specifies the password for the specified SiteMinder administrator.

   Note: Ensure the file_name.smdif file ends with a .smdif and not a .txt extension.

   Example: smobjexport -opstore.smdif -c -dSiteMinder -wpassword -v -t

   Note: The -ofile_name argument should use a filename other than the one used for the smldapsetup ldgen -ffile_name; otherwise the export may be overwritten.
Export Policy Store Objects With Dependencies

When exporting policy store objects with dependencies by either running smobjexport with the –e option or by using the migration methods in the Command Line Interface:

- If any of the object’s dependencies is a Host Configuration Object, then all Host Configuration Objects are exported.
- If any of the object’s dependencies is an Agent Configuration Object, then all Agent Configuration Objects are exported.
- If any of the object’s dependencies is an affiliate (when Policy Server Option Pack is installed), then the entire affiliate domain to which the affiliate belongs is exported.

Note: The -e option does not support exporting Affiliate domains.

Import Policy Data Using smobjimport

The smobjimport tool imports the entire policy store or a single policy domain using two files--an .smdif (SiteMinder Data Interchange Format) and a .cfg (environment configuration) file--created by smobjexport. The .smdif file standardizes SiteMinder data so you can import it into an ODBC or LDAP directory. For example, you can export an .smdif file from an ODBC database and import it to an LDAP directory. The environment configuration (.cfg) file contains environment specific properties for the policy store such as the IP Addresses, redirection URLs, shared secrets, and logging settings. The text in the .cfg file is separated by tabs and you can read it in an Excel spreadsheet.

Using the Command Line Interface, you can write Perl scripts to import and export particular objects rather than all the Policy Store objects. For more information, see the SiteMinder Programming Guide for Perl.

Note: The naming convention for smobjimport is the same as smobjexport in that it supports an .smdif file and .cfg file. Using smobjexport as an example, if the output file you specified with the smobjexport command has an .smdif extension (that is, file_name.smdif), then the extension is replaced with .cfg (such as file_name.cfg) for the configuration file. However, if the output file you specify does not have an .smdif extension (that is, file_name.txt), then .cfg is appended to file name and extension (such as file_name.txt.cfg).
smobjimport uses the following arguments to supply information required to import data:

-4
  Allows you to import policy store data from SiteMinder 4.51/4.61.

-ifile_name
  Specifies the path and file name of the input .smdif file.

-f
  Indicates that duplicate information should be overwritten. Be careful using this argument as it enables you to overwrite default SiteMinder objects that may have been imported into a new policy store by using smpolicy.smdif.

-c
  Indicates that the input file contains sensitive data in clear-text. This argument allows you to import policy data from a SiteMinder deployment that uses one encryption key to another SiteMinder deployment that uses a different encryption key. This option requires the credentials of a SiteMinder administrator who can manage all SiteMinder domain objects. Enter credentials using the -d and -w arguments.

-dadmin-name
  Specifies the login name of a SiteMinder Administrator that can manage all SiteMinder objects.

-wadmin-pw
  Specifies the password of the SiteMinder Administrator specified in -d.

-k
  Imports Agent keys stored in the policy store. If you import using this argument, and the policy store to which you are importing already contains keys, single sign-on for existing users may be interrupted. Note that keys are created each time you start the Policy Server.

-v
  Enables verbose mode.

-t
  Enables low level tracing mode. This can be used to troubleshoot the import process.

-l
  Creates a log file. Make sure the file_name.smdif file ends with an .smdif and not a .txt or other extension. If the file_name.smdif file ends with an .smdif extension, smobjimport creates a log file with a .log extension. However, if the file_name.smdif file ends with a .txt extension, smobjimport creates a file_name.txt.log file, which is incorrect since the log file must be in the file_name.log format.
-r

Turns off automatic renaming of objects. By default, when smobjimport attempts to import an object with a name that already exists in the target policy store, it creates a duplicate object with a name of nameoid, where name is the name of the object, and oid is the object ID of the new duplicate object. If you use this flag to turn off the automatic renaming feature, smobjimport returns errors messages for any objects that could not be created because of naming conflicts.

-u

Import variables only.

-m

Import IdentityMinder objects only.

+ m

Import SiteMinder objects only.

-?

Displays the help message.

-a1

Disables object store validation and helps increase the speed at which objects are imported.

Important! This parameter should only be used when importing data into a new policy store and when the imported .smdif file is consistent with regards to policy store objects.

-a2

Disables object store auditing and helps increase the speed at which objects are imported.

-a3

Disables object store cache updates and helps increase the speed at which objects are imported.

Important! Do not use this parameter when importing data into an existing policy store with more than one policy store pointing at it. Using this parameter disables cache synchronization between the Policy Servers.
Overview of the XML-based Data Format

Enterprise environments can require policy store data to be moved from one environment to another, such as from a development environment to a staging environment. In releases prior to r12, policy objects are represented using the proprietary SiteMinder Data Interchange Format (SMDIF), using smobjimport and smobjexport for migrating the data. This export format and these tools have been replaced by an XML-based export format, using XPSExport and XPSImport to migrate the data.
The XML-based export format uses the following fundamental schemas:

**XPSDeployment.xsd**
Describes the top-level schema, which includes the other schemas. It defines the root element and sub-elements. An XML file conforming to this schema can contain an instance of Data Dictionary, Policy, and Security Data.

**XPSDataDictionary.xsd**
Describes meta-data information about object types and their properties.

**XPSPolicyData.xsd**
Describes the meta-data information about objects stored in the policy store, such as domains, policies, rules, applications, and the relationships between them.

**XPSSecurityData.xsd**
Describes meta-data used for representing policy store administrators and their access rights.

**XPSGeneric.xsd**
Contains definitions of the generic data types used in the other schema files.

This format supports not only exporting and importing policy data in its entirety, but also exporting and importing a subset of the policy data. A granular export presupposes knowledge of how the data will be imported. On export, you can specify the entire policy data, or a portion of the data using an object identifier and optionally one of these three export types:

- **Add**—specifies that only additions can be done during import.
- **Replace**—specifies an overwrite of existing policy data during import.
- **Overlay**—specifies that updates to policy data are done during import.

**Note:** The XPSExport and XPSImport tools encrypt sensitive data based on the FIPS mode the Policy Server is operating in. There are no additional parameters in these tools to set for data encryption.

### Export Policy Data Using XPSExport

The XPSExport tool supports the following tasks for migrating Policy Store data:

- Export all the data dictionary.
- Export all the security data.
- Export all the policy data.
Export all the configuration data.

Export a portion of the policy data.

You can export a subset of policy data by specifying a root object’s identifier in the command line or in a file (using the -xf parameter). Only objects that do not have a parent class can be exported. For example, to export a realm object, you specify the identifier (XID) of the realm’s parent domain.

You can also create and edit a custom export file using the "shopping cart", or XCart, capability in XPSExplorer (xspexplorer -xf ). You can set the import mode (ADD, OVERLAY, REPLACE, or DEFAULT) on a per object basis in the XCart file. You can then pass the XCart file to XSPExport using the -xf parameter.

**Note:** XSPExport does not export keys from the key store. You must use smkeyexport for this purpose.

**Syntax**

The syntax of the XSPExport is following:

**Parameters**

- **output_file**
  The output XML file.

- **-xo object_XID**
  Specifies one or more objects for granular export. You can optionally specify one of the following export types:

  - **-xo-add object_XID**
    Specifies only additions are done during import.

  - **-xo-replace object_XID**
    Specifies policy data is overwritten during import.

  - **-xo-overlay object_XID**
    Specifies policy data is updated during import.
-xf file_name

(Optional) Specifies the absolute name of a file that contains the list of XIDs of objects to be exported.

The entries in the file have the following format:

CA.SM::UserDirectory@0e-255e2456-556d-40fb-93cd-f2fed81f656e
ADD = CA.SM::AuthScheme@0d-4afc0e41-ae25-11d1-9cdd-006008aac24b
REPLACE = CA.SM::Agent@01-cb8b3401-a6aa-4794-964e-c569712269c0
OVERLAY = CA.SM::Domain@03-7bdf31f2-44d7-4d7b-a8f5-5de2eaa0b634

These entries correspond to the following command-line parameters:

-xo CA.SM::UserDirectory@0e-255e2456-556d-40fb-93cd-f2fed81f656e
-xo-add CA.SM::AuthScheme@0d-4afc0e41-ae25-11d1-9cdd-006008aac24b
-xo-replace CA.SM::Agent@01-cb8b3401-a6aa-4794-964e-c569712269c0
-xo-overlay CA.SM::Domain@03-7bdf31f2-44d7-4d7b-a8f5-5de2eaa0b634

-xa

(Optional) Exports entire policy data.

Note: This option cannot be used with -xo, -xo-add, -xo-replace, -xo-overlay, or -xf.

-xd

(Optional) Exports the entire data dictionary.

-xs

(Optional) Exports the entire security data.

-xc

(Optional) Exports the entire configuration data.

-passphrase phrase

(Optional) Specifies the passphrase required for encryption of sensitive data. This must be at least eight characters long and must contain at least one digit, one uppercase and one lowercase character. The passphrase can contain a space enclosed in quotes. If not specified as a command-line option, the export process prompts for a passphrase when sensitive data is being exported.

-?

Displays command-line help.

-vT

(Optional) Sets verbosity level to TRACE.
-vI
(Optional) Sets verbosity level to INFO.

-vW
(Optional) Sets verbosity level to WARNING (default).

-vE
(Optional) Sets verbosity level to ERROR.

-vF
(Optional) Sets verbosity level to FATAL.

-l log_file
(Optional) Outputs log to the specified file.

-e err_file
(Optional) Specifies the file to which errors and exceptions are logged. If omitted, stderr is used.

Example

XPSExport PolicyData.xml -xo CA.SM::UserDirectory@0e-255e2456-556d-40fb-93cd-f2led81f656e
-xo overlay CA.SM::Domain@03-7bdf31f2-44d7-4d7b-a8f5-5de2ea0b634 -x -e C:\tmp\ExceptionLog.txt

Note: In case of granular export, the export type will either be specified explicitly on the command line or will be retrieved from the data dictionary in case it is not specified on the command line. For dump export, the export type attribute for all objects is Replace (whatever the data dictionary value for the object class is set to) because a load import of the policy data is effectively an overwrite of the entire policy data in the policy store.

During the execution of XPSExport, if any error is encountered during the parsing of the command line options, the export tool aborts and logs the errors encountered in the exception file (or stderr). Also, the export process aborts if the export of any object fails. In such a scenario, appropriate errors are logged to the exception file (or stderr) and the XML output file (if it has been created) is deleted.
Add Policy Data

The diagram following shows a SiteMinder policy domain named Domain1 in the source policy store that has to be exported and imported to the target policy store.

The target policy store already has a domain with the same name, but there are differences between the two:

- The properties of Realm1 have been updated in the source policy store and consequently have different values from their counterparts in the target policy store.
- There is a Realm2 in Domain1 that does not exist in the target policy store.

To specify a granular import of only one object (Realm2) into the target policy store, the command line on export would look like this:

```
XPSExport gran-add.xml -xo add CA.SM: :Domain@03-0fb7bd02-6986-4bb9-b240-c232358958b1
```
After a successful import Domain1 in the target policy store has three realms. The properties of Realm1 are not updated, as shown in the figure following.

Overlay Policy Data

The diagram following shows a SiteMinder policy domain named Domain1 in the source policy store that has to be exported and imported to the target policy store.
The target policy store already has a domain with the same name, but there are differences between the two:

- The properties of Realm1 have been updated in the source policy store and consequently have different values from their counterparts in the target policy store.
- There is a Realm2 in Domain1 that does not exist in the target policy store.

To specify a granular import where the target policy store is updated with the latest changes from the source policy store, the command line on export would look like this:

```
XPSExport gran-add.xml -xo overlay CA.SM: :Domain@03-0fb7bd02-6986-4bb9-b240-c232358958b1
```

After a successful import the properties of Realm1 on the target policy store are updated, as shown in the figure following.
Replace Policy Data

The diagram following shows a SiteMinder policy domain named Domain1 in the source policy store that has to be exported and imported to the target policy store.

The target policy store already has a domain with the same name, but there are differences between the two:

- The properties of Realm1 have been updated in the source policy store and consequently have different values from their counterparts in the target policy store.
- There is a Realm2 in Domain1 that does not exist in the target policy store.

To duplicate the contents of the source policy store in the target policy store, the command line on export would look like this:

```
XPSExport gran-add.xml -xo-replace CA.SM: :Domain@03-0fb7bd02-6986-4bb9-b240-c232358958b1
```
After a successful import Domain1 in the target policy store is exactly the same as Domain1 in the source policy store, as shown in the figure following.

Source Policy Store

- Domain1
  - Realm1
  - Realm2

Target Policy Store

- Domain1
  - Realm1 (updated)
  - Realm2

**Import Policy Data Using XPSImport**

The XPSImport tool supports the following tasks for migrating policy store data:

- Import the entire policy data.
- Import a portion of the policy data.
- Import configuration data.

**Note:** XPSImport does not import keys into the key store. You must use smkeyimport for this purpose.

**Syntax**

The syntax for XPSImport is:

```
```

**Parameters**

- **input_file**
  Specifies the input XML file.

- **-passphrase phrase**
  (Optional) Specifies the passphrase required for decryption of sensitive data. The phrase must be the same as the phrase specified during export, or the decryption will fail.

- **-validate**
  (Optional) Validates the input XML file without updating the database.
-fo
  Allows force overwrite of existing policy store data for a dump load.

-vT
  (Optional) Sets verbosity level to TRACE.

-vI
  (Optional) Sets verbosity level to INFO.

-vW
  (Optional) Sets verbosity level to WARNING (default).

-vE
  (Optional) Sets verbosity level to ERROR.

-vF
  (Optional) Sets verbosity level to FATAL.

-l log_path
  (Optional) Outputs a log file to the specified path.

-e file_name
  (Optional) Specifies the file to which errors and exceptions are logged. If omitted, stderr is used.

-?
  Displays command-line help.

**Example**

XPSImport PolicyData.xml -e C:\tmp\ExceptionLog.txt

This example imports policy data objects as specified in the PolicyData.xml file. It is not immediately evident from the command line if the import is a dump load or a granular import. That information can however be retrieved by looking at the IsDumpExport attribute of <PolicyData> element in the input XML file. If this attribute is set to true, it indicates that the input XML file has to be used for dump load.
Troubleshooting Policy Data Transfer

The following factors might possibly be relevant when transferring policy store data:

- Errors are logged to the console (stdout/stderr) or directed to a file.
- The levels of logging are listed following:
  - Trace
  - Information
  - Warning
  - Error
  - Fatal
- An export fails if the file already exists.
- An import is rolled back if validation fails for an object in the XML file.
- Granular import fails if objects exported with Add type already exist in the target policy store.

Export and Import Stored Keys

XPSExport and XPSImport do not handle moving keys to and from the key store. For this purpose you must use smkeyexport and smkeyimport.

The smexportkey tool exports keys from the key store. The syntax for smkeyexport is following.

```
```

- **-d**
  Specifies the name of the SiteMinder administrator.

- **-w**
  Specifies the password of the SiteMinder administrator.

- **-o**
  (Optional). Specifies the output file; defaults to stdout.smdif.

- **-f**
  (Optional). Overwrites an existing output file.

- **-c**
  (Optional). Exports sensitive data unencrypted.
-cb
(Optional). Exports sensitive data encrypted with backward-compatible cryptography.

-cf
(Optional). Exports sensitive data encrypted with FIPS-compatible cryptography.

-l
(Optional). Creates and logs entries to the specified file (filename.log).

-v
(Optional). Specifies verbose messaging.

-t
(Optional). Enables tracing.

-?
(Optional). Displays command options.

The smkeyimport tool imports keys into the key store. The syntax of smkeyimport is following:

-i
Specifies the input file name.

d
Specifies the name of the SiteMinder administrator.

-w
Specifies the password of the SiteMinder administrator.

-c
(Optional). Specifies that the input file contains clear-text passwords.

-cb
(Optional). Imports clear-text passwords with backward-compatible cryptography.

-cf
(Optional). Imports clear-text passwords with FIPS-compatible cryptography.

-l
(Optional). Creates and logs entries to the specified file (file.log).
Manage an LDAP Policy Store Using smldapsetup

The smldapsetup utility allows you to manage an LDAP policy store from the command line. Using smldapsetup, you can configure an LDAP policy store, generate an LDIF file, and remove policy store data and schema.

To use smldapsetup, specify a mode, which determines the action that smldapsetup will perform, and arguments, which contain the values that are used to configure the LDAP server.

The following table contains the modes you can use with smldapsetup and the arguments each mode uses:

<table>
<thead>
<tr>
<th>Modes</th>
<th>Arguments</th>
</tr>
</thead>
<tbody>
<tr>
<td>reg</td>
<td>-hhost, -pportnumber, -duserdn, -wuserpw, -rroot, -ssl1</td>
</tr>
<tr>
<td>ldgen</td>
<td>-hhost, -pportnumber, -duserdn, -wuserpw, -rroot, -mn, -ssl1</td>
</tr>
<tr>
<td>ldmod</td>
<td>-hhost, -pportnumber, -duserdn, -wuserpw, -rroot, -ssl1</td>
</tr>
<tr>
<td>remove</td>
<td>-hhost, -pportnumber, -duserdn, -wuserpw, -rroot, -ssl1</td>
</tr>
<tr>
<td>switch</td>
<td>none</td>
</tr>
<tr>
<td>revert</td>
<td>-v</td>
</tr>
<tr>
<td>status</td>
<td>-v</td>
</tr>
</tbody>
</table>
To use smldapsetup

1. Navigate to one of the following locations:
   - (Windows) `siteminder_home\bin`
   - (UNIX) `siteminder_home/bin`

   `siteminder_home`
   Specifies the installed location of SiteMinder.

2. Enter the following command:

   `smldapsetup mode arguments`

   **Important!** If you are running a SiteMinder utility or executable on Windows Server 2008, be sure to open the command-line window with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

   **Example:** `smldapsetup reg -hldapserver.mycompany.com -d"LDAP User" -wMyPassword123 -ro=security.com`

   **Note:** When running smldapsetup, make sure that the LDAP user you specify has the appropriate administrator privileges to modify schema in the LDAP Directory Server. If this user does not have the proper privileges, then the LDAP server will not allow you to generate the policy store schema. After running the smldapsetup command, this user appears in the Admin Username field on the Data tab of the Policy Server Management Console.

**More Information:**

- [Modes for smldapsetup](#) (see page 178)
- [Arguments for smldapsetup](#) (see page 179)
Modes for smldapsetup

The mode indicates the action that smldapsetup performs. You can specify a mode to connect to the LDAP server, generate an LDIF file, configure an LDAP policy store and remove policy data.

The modes for smldapsetup include:

**reg**
Tests the connection to the LDAP server. If the connection succeeds, smldapsetup configures the SiteMinder LDAP server as its policy store using the `-h host`, `-p portnumber`, `-d userdn`, `-w userpw`, `-r root`, `-ssl 1/0` and `-c certdb` arguments.

**ldgen**
Automatically detects supported LDAP servers and generates an LDIF file with the SiteMinder schema. The generated file is used by smldapsetup ldmod to create the SiteMinder schema. If the `-e` argument is specified, smldapsetup ldgen creates an LDIF file that can be used with ldmod to delete the SiteMinder schema. Use the `-m` switch to skip automatic detection of LDAP servers. The ldgen mode requires the `-f` switch unless previously configured in reg mode.

**ldmod**
Connects to the LDAP server and the SiteMinder schema without populating the policy store with any data. It requires the LDAP modify program and the LDIF file, specified with the `-fdif` argument. If you specify the `-h host`, `-p port_number`, `-d userdn`, `-w userpw`, `-r root`, `-ssl 1/0` and `-c certdb` arguments, smldapsetup ldmod will modify the LDAP directory specified using these arguments. If you do not specify `-h host`, `-p portnumber`, `-d userdn`, `-w userpw`, `-r root`, `-ssl 1/0` and `-c certdb`, smldapsetup ldmod uses the LDAP directory previously defined using smldapsetup reg or the Policy Server Management Console.

**remove**
Connects to the LDAP server, then removes all policy data stored under the SiteMinder LDAP node that corresponds to the current version of smldapsetup. If you specify the `-h host`, `-p port_number`, `-d userdn`, `-w userpw`, `-r root`, `-ssl 1/0` and `-c certdb` arguments, smldapsetup remove will remove policy data from the LDAP directory specified by these arguments. If you do not specify `-h host`, `-p port`, `-d userdn`, `-w userpw`, `-r root`, `-ssl 1/0` and `-c certdb`, smldapsetup remove will remove the policy data from the LDAP directory previously defined using smldapsetup reg or the Policy Server Management Console.

**switch**
Reconfigures the Policy Server to use LDAP rather than ODBC. It does not prepare the LDAP store or the LDAP connection parameters before making the change.
revert

Reverts to ODBC policy store from LDAP. The only argument used with this mode is -v.

status

Verifies that the LDAP policy store connection parameters are configured correctly. It requires the -v argument. If you specify the -h <host>, -p <port_number>, -d <userdn>, -w <userpw>, -r <root>, -ssl <1/0> and -certdb arguments, smldapsetup status tests the connection to the LDAP directory specified using these arguments. If you do not specify -h <host>, -p <port_number>, -d <userdn>, -w <userpw>, -r <root>, -ssl <1/0> and -certdb, smldapsetup status verifies the connection to the LDAP directory previously defined using smldapsetup reg or the Policy Server Management Console.

From the Data tab in the Policy Server Management Console, you can view or change the settings you configured with the reg, switch and revert functions using a GUI interface. You must use smldapsetup to perform the ldgen, ldmod, remove, and status functions.

Arguments for smldapsetup

Arguments allow you to specify the information used by the modes to manage the LDAP policy store. If you do not specify arguments, smldapsetup uses the values configured in the Policy Server Management Console.

Note: smldapsetup does not allow spaces between an argument and its value. For example, the -h argument should be specified as follows:
smldapsetup ldmod -hldapserver.mycompany.com

The arguments you can specify in an smldapsetup call are listed below:

-hhost

Specifies the fully qualified name of the LDAP server; the relative name, if the machines are in the same domain (-hldapserver); or the IP address (-h123.12.12.12). If you do not specify a host, smldapsetup uses the previously configured value as the default.

Example: -hldapserver.mycompany.com

-pport_number

Specifies a non-standard LDAP port. The LDAP port must be specified if the LDAP server is using a non-standard port or if you are moving a server to a new server that uses a different port, such as moving from a server using SSL to one that is not. If a port is not specified, the previous configuration values are used. If no previous port configuration has been specified, smldapsetup uses the default ports 389, if SSL is not being used, or 636, if SSL is being used.
-**duserdn**

Specifies the LDAP user name of a user with the power to create new LDAP directory schema and entries. This is not necessarily the user name of the LDAP server administrator. If you do not specify a user name, smldapsetup uses the previously configured name as the default.

-**wuserpw**

Specifies the password for the user identified in the -d argument. If you do not specify a password, smldapsetup uses the previously configured value.

Example: -wMyPassword123

-**root**

Specifies the distinguished name of the node in the LDAP tree where SiteMinder will search for the policy store schema. If you do not specify a root, smldapsetup uses the previously configured root.

Example: -ro=security.com

-**e**

When specified with smldapsetup ldgen, generates an LDIF file that can delete the SiteMinder schema. The generated file must be used with smldapsetup ldmod to remove the schema.

-**mn**

Skips automatic detection of LDAP servers and specify type of LDAP policy store where $n$ is one of the following:

2

iPlanet v4 LDAP servers.

3

Active Directory LDAP servers.

4

Oracle Internet Directory.

5

iPlanet v5.

6

Sun Directory Servers.

9

Active Directory Application Mode (ADAM).
Manage an LDAP Policy Store Using smldapsetup

Chapter 17: Policy Server Tools

-fldif
Specifies the absolute or relative path to an LDIF file from the directory in which smldapsetup is being executed.

Example: -f../siteminder/db/smldap.ldif

Default: if you do not specify a path, smldapsetup uses the current directory as the default.

-ttool
Specifies the absolute or relative path, including filename and extension, of the ldapmodify command line utility. Ldapmodify is used to configure the server schema using the LDIF format commands. LDAP servers and SiteMinder provide a copy of ldapmodify. If the utility is not in the default location, use this argument to specify its location.

-ssl1_or_0
Specify -ssl1 to use an SSL-encrypted connection to the LDAP server, and -ssl0 to use a non-SSL connection. If you do not specify a value for -ssl, smldapsetup uses the previously configured value. If the LDAP connection has not been configured before, the initial default value is 0.

-ccert
This argument must be specified when using an SSL encrypted (-ssl1) LDAP connection. Specifies the path of the directory where the SSL client certificate database file, which is usually called cert7.db for the Netscape Navigator Web browser, exists.

Note: For policy stores using an SSL-encrypted connection to Sun Java System LDAP, make sure the key3.db file exists in the same directory as cert7.db.

-k-k1
Enables you to use smldapsetup to set up or modify a key store if you are storing key information in a different LDAP directory. If you specify -k, smldapsetup checks to see if the Policy Server is pointing to the key store before performing any functions. If the Policy Server is not pointing to the key store, smldapsetup issues a warning. If you specify -k1, in conjunction with smldapsetup ldgen and the other arguments for a new policy store, smldapsetup creates a separate key store in the location you specify. If you do not specify -k or -k1, smldapsetup will modify the policy store.

-v
Enables verbose mode for troubleshooting. With -v, smldapsetup logs its command-line arguments and configuration entries as it performs each step in the LDAP migration.
-**userDN**

Specifies the distinguished name of an account that should be used by SiteMinder to make modifications to the policy store. This argument allows an administrator account to retain control of the SiteMinder schema while enabling another account that will be used for day-to-day modifications of SiteMinder data. When a change is made using the Administrative UI, the account specified by this argument is used. Be sure to enter the entire DN of an account when using this argument.

-**q**

Enables quiet mode for no questions to be asked.

-**u**

Creates a 6.x upgrade schema file (LDIF).

-**x**

Use the -x argument with ldmod to generate replication indexes for another 5.x Sun Java System Directory Server Enterprise Edition (formerly Sun ONE/iPlanet) LDAP directory server.

-**suffix**

This option allows you to specify a suffix other than the default parent suffix when configuring the 6.x Policy Server's schema in a Sun Java System Directory Server Enterprise Edition (formerly Sun ONE/iPlanet) LDAP directory server.

Example: assume the following:

```
ou=Apps,o=test.com is the Policy Store root.
o=test.com is the root suffix.
ou=netegrity,ou=Apps,o=test.com is the sub suffix.
```

If you do not use the -s parameter with smldapsetup, the Policy Server assigns `ou=Apps,o=test.com` as a parent suffix of `ou=netegrity,ou=Apps,o=test.com`. To change this and have the appropriate parent suffix set, run smldapsetup using the -s parameter while specifying o=test.com.

-**?**

Displays the help message.

**Note:** If the arguments contain spaces, you must enter double quotes around the entire argument. For example, if the name of the SiteMinder administrator is LDAP user, the argument for smldapsetup would be: `-d"LDAP user"`. 
smldapsetup and Sun Java System Directory Server Enterprise Edition

In a Sun Java System Directory Server Enterprise Edition (formerly Sun ONE/iPlanet) directory server, smldapsetup creates the ou=Netegrity, root sub suffix and PolicySvr4 database.

**root**

The directory root you specified in the Root DN field on the Data tab of the Policy Server Management Console. This variable has to be either an existing root suffix or sub suffix.

**Example:** If your root suffix is dc=netegrity,dc=com then running smldapsetup produces the following in the directory server:

- A root suffix, dc=netegrity,dc=com, with the corresponding userRoot database.
- A sub suffix, ou=Netegrity,dc=netegrity,dc=com, with the corresponding PolicySvr4 database.

**Example:** If you want to place the policy store under ou=apps,dc=netegrity,dc=com, then ou=apps,dc=netegrity,dc=com has to be either a root or sub suffix of the root suffix dc=netegrity,dc=com.

If it is a sub suffix, then running smldapsetup produces the following:

- A root suffix, dc=netegrity,dc=com, with the corresponding userRoot database.
- A sub suffix, ou=apps,dc=netegrity,dc=com, with the corresponding Apps database.
- A sub suffix, ou=Netegrity,ou=apps,dc=netegrity,dc=com, with the corresponding PolicySvr4 database.

**Note:** For more information about root and sub suffixes, see the Sun Microsystems documentation.
Remove the SiteMinder Policy Store using smldapsetup

To remove the SiteMinder policy store data and schema from an LDAP directory, you must first delete the data, then remove the schema.

Important!

- Before removing the SiteMinder policy store data, be sure that the Policy Server is pointing to the policy store that contains the data you want to delete. smldapsetup will remove the data from the policy store to which the Policy Server is pointing. Additionally, export the policy store data to an output file and create a backup of the file before removing the data.
- If you are running a SiteMinder utility or executable on Windows Server 2008, be sure to open the command-line window with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

To remove the policy store using smldapsetup

1. Navigate to the following location:
   - (Windows) siteminder_home\bin
   - (UNIX) siteminder_home/bin

   `siteminder_home`
   
   Specifies the installed location of SiteMinder.

2. Remove the policy store data by entering the following command:

   ```bash
   smldapsetup remove -h LDAP_IP_Address -p LDAP_Port
   -d LDAP_Admin -w LDAP_Admin_Password -r LDAP_Base_DN
   -v
   
   Example: smldapsetup remove -h192.169.125.32 -p552 -d"cn=directory manager" -wfirewall -rdc=ad,dc=test,dc=com -v
   
   Note: Removing the policy store data may take a few moments.
   
3. Generate the LDIF file you will use to delete the schema by entering the following:

   ```bash
   smldapsetup ldgen -e -f ldif
   
   ldif
   
   Specifies the name of the LDIF file you are generating.

   Example: smldapsetup ldgen -e -f delete.ldif
   ```
4. Remove the SiteMinder schema by executing the following command:
   `smldapsetup ldmod -f ldif
   ldif`

   *ldif*
   
   Specifies the name of the LDIF file you generated using `smldapsetup ldgen` `-e`.  
   
   **Example:** `smldapsetup ldmod -f delete.ldif`

---

**Delete SiteMinder Data in ODBC Databases**

SiteMinder provides SQL scripts that delete the SiteMinder schema from ODBC databases. The following list describes each SQL script:

**sm_oracle_ps_delete.sql**

Removes the SiteMinder 6.x policy store and data from an Oracle database.

**sm_oracle_logs_delete.sql**

Removes SiteMinder 6.x logs stored in an Oracle database if the database was created using `sm_oracle_logs.sql`.

**sm_oracle_ss_delete.sql**

Removes the SiteMinder 6.x Session Server tables and data from an Oracle database.

**sm_mssql_ps_delete.sql**

Removes the SiteMinder 6.x policy store and data from an SQL database.

**sm_mssql_logs_delete.sql**

Removes SiteMinder 6.x logs stored in an SQL database if the database was created using `sm_mssql_logs.sql`.

**sm_mssql_ss_delete.sql**

Removes the SiteMinder 6.x Session Server tables and data from a SQL database.

**sm_db2_ps_delete.sql**

Removes the SiteMinder 6.x policy store and data from a DB2 database.

**sm_db2_logs_delete.sql**

Removes SiteMinder 6.x logs stored in a DB2 database if the database was created using `sm_db2_logs.sql`.

**sm_db2_ss_delete.sql**

Removes the SiteMinder 6.x Session Server tables and data from a DB2 database.
Check Solaris Patches with smpatchcheck

The ODBC database SQL scripts are in the following location:

- (Windows) `siteminder_home\db`
  
  `siteminder_home`
  
  Specifies the Policy Server installation path.

- (UNIX) `siteminder_home/db`
  
  `siteminder_home`
  
  Specifies the Policy Server installation path.

Delete the database objects by running the appropriate SQL script using DB2, SQL Plus for Oracle, or SQL Server Query Analyzer.

**Note:** For more information about running SQL scripts, see your database documentation.

---

**Check Solaris Patches with smpatchcheck**

SiteMinder provides a utility, called smpatchcheck, that checks whether or not you have the Solaris patches required for the Policy Server and Web Agent installed on your system. Smpatchcheck can be run on the Solaris versions listed on the SiteMinder Platform Matrix. To access this matrix, go to [Technical Support](#) and search for the SiteMinder Platform Support Matrix.

**To use smpatchcheck**

1. Navigate to `siteminder_home/bin`
   
   `siteminder_home`
   
   Specifies the Policy Server installation path.

2. Enter smpatchcheck.

   Smpatchcheck looks for each required/recommended patch and then displays its status.

   For example:

   ```
   Testing for Required Patches:
   
   Testing for Patch: 106327-09 ... NOT Installed
   
   Testing for Recommended Patches:
   
   Testing for Patch: 106541-08 ... Installed
   
   SiteMinder Patch Check: Failed
   ```
SmPatchCheck returns one of the following messages:

**Failed**
One or more of the required patches is not installed.

**Partially Failed**
One or more of the recommended patches is not installed.

**Success**
All of the required and recommended patches are installed.

---

**Import Tokens Using the SiteMinder Token Tool**

SiteMinder supports hardware–based security cards or tokens. Tokens use a dynamically generated password to provide an additional level of security.

All tokens require a data file provided by the vendor. Some tokens, such as ACE, access the token data file remotely on the server of the vendor. Most tokens access the token database locally through the SiteMinder Token Tool.

The administrator must import a token data file before assigning tokens to users. This file, which the token vendor provides, contains the identification or serial number for each token you are licensed to install.

**To import the token data file**

1. Before using this tool, be sure that the Policy Server is running and configured with policy store.
2. From the Windows Start menu, select Programs, SiteMinder, SiteMinder Token Tool.
3. (Optional) If you want to overwrite existing tokens, select Overwrite duplicate tokens.
4. Specify the type of token in the Pick field and click Import.
   The Open dialog appears.
5. Select the location from which to import the token data file and click Open.
   You can either import this file from your hard drive or directly from an installation disk. The Token Tool displays a list of all the serial numbers installed in the database.
6. Click Exit to close and exit the token utility.
SiteMinder Test Tool

The SiteMinder Test Tool is a utility that simulates the interaction between Agents and Policy Servers. It tests the functionality of the Policy Server. During testing, the Test Tool acts as the Agent, making the same requests to the Policy Server as a real Agent. This allows you to test your SiteMinder configuration before deploying it.

Note: For further information about this tool, see the Policy Server Configuration Guide.

Change the SiteMinder Super User Password Using smreg

To change the super user password
1. Be sure that the Policy Server is running and pointed at a configured policy store.
2. Be sure that the smreg utility is located in policy_server_home\bin.

   policy_server_home
   
   Specifies the Policy Server installation path.

   Note: If the utility is not present, you can find it in the Policy Server installation media available on the Support site.

3. Run the following command:

   smreg -su password

   password
   
   Specifies the password for the SiteMinder super user account.

   Note: Be sure that there is a space between -su and the password.
   The utility changes the super user account password.

4. Delete the smreg utility.
   Deleting the utility prevents anyone from changing the super user password.
How to Count the Users in your SiteMinder Environment

To comply with the terms of your SiteMinder license, you can count the number of users in your SiteMinder environment. The following process describes how to configure your directories and count the SiteMinder users stored within them:

1. Make the following changes to each user directory you want to count:
   - **Note:** For more information, see the *SiteMinder Policy Server Configuration Guide*.
     - Require the use of Administrator Credentials by entering the user name and password of the directory administrator in the Administrative UI.
     - Define a Universal ID and other user attribute mappings using the Administrative UI.
   2. For Microsoft Active Directory user stores, map the inetOrgPerson attribute using the Administrative UI.
   3. Determine the number of users associated with SiteMinder policies.
Map the Active Directory inetOrgPerson Attribute

If any of your SiteMinder user stores are on Microsoft Active Directory servers, you need to map the inetOrgPerson in each Active Directory server before counting the SiteMinder users in it.

**To map the inetOrgPerson attribute**

1. Open the Administrative UI.
   The search screen appears.
3. Click the Directory you want and click Select.
4. In the Attribute Mapping List group box, click Create.
   The Create Attribute Mapping dialog appears.
5. Click Create a new object of type Attribute Mapping, and then click OK.
   The Create Attribute Mapping: dialog appears.
6. Click the Name field and type the following:
   `inetOrgPerson`
7. (Optional) We recommend clicking the Description Field and enter the following:
   Custom Mapping to Count Active Directory Users (with XPSCounter)
8. In the properties group box, do the following:
   a. Make sure the Alias radio button is selected.
   b. Click the Definition field and type the following:
      `User`
9. Click OK.
   The Modify User Directory window appears.
10. Click Submit.
   Your changes are saved and the inetOrgPerson attribute is mapped.
Determine the Number of Users Associated with SiteMinder Policies

To comply with the SiteMinder licensing terms, you can determine how many users in your organization are associated with SiteMinder policies.

**Note:** If you do not have write access to the SiteMinder binary files (XPS.dll, libXPS.so, libXPS.sl), an Administrator must grant you permission to use the related XPS command line tools using the Administrative UI or the XPSSecurity tool.

**To determine the number of users**

1. Open a command window on the Policy Server, and then enter the following command:
   
   XPSCounter
   
   The tool starts and displays the name of the log file for this session, and the License Parameters menu opens.
2. Enter 1.
   
   The Parameter menu appears.
3. Enter C.
   
   The Counter menu appears.
4. Enter I.
5. Enter ? to search for a user directory XID. Only those user directories that are defined in your policy store appear in the list.
6. Enter the number of the directory that contains the users you want to count.
   
   **Note:** This tool counts the number of user objects in each directory that you specify. It does not account for the same user object being listed in multiple directories or multiple user objects for the same user in a directory. You must consider this when interpreting the results provided by this tool.
7. (Optional) Enter a comment to describe the results.
   
   The users are counted and a confirmation message appears.
8. (Optional) Repeat Steps 5 through 8 to count the users in another directory.
9. Enter V.

The following information appears for each directory counted:

**XID**
Displays the unique identifier for the specified user directory.

**Example:**
CA.SM::UserDirectory@0e-50ea30f0-b5c0-450c-a135-1e317dd25f11

**Name**
Displays the name of the specified user directory (as defined in the Administrative UI).

**count**
Displays the most-recent user count of the specified user directory. You do not have to delete any previous values stored in the counter because this value is updated automatically every time the counter is run.

**Example:** : 23

**Total**
Displays the total of number of users from all of the user directories you counted. For example, if you counted number of users for two different directories, and each directory has 23 users, the total shown will be 46.

**XPSCConfig—Manage Product Parameters**

XPSCConfig is an interactive command-line utility that allows administrators and members of operations to view product parameters and, if allowed, edit their settings. While you may have your own product-specific configuration tool using XPS programming interfaces, XPSCConfig is available so that this is not a requirement.

For each vendor and installed product, XPSCConfig manages the parameters or named settings that are defined in the product's Data Dictionary. Each product can read, write, and validate its own parameter settings.

To use XPSCConfig, you must be an administrator with XPSCConfig rights.
Parameters have the following attributes:

Name
   Specifies the name of the parameter.

   Limits:
   - Names must start with a letter or underscore and contain only letters, numbers, and underscores.
   - Names can be up to 32 characters in length.
   - Names are not case-sensitive.

Type
   Specifies the data type of the parameter value:

   Logical | Numeric | String

   Logical
      Specifies a Boolean value: TRUE or FALSE.

   Numeric
      Specifies an integer.

   String
      Specifies a string of characters.

Scope
   Specifies the value or scope of the parameter:

   Ask | Global | Local | Managed | Overrideable | Read Only

   Ask
      Specifies that the value is managed by the product, not by XPS, and that the value is read only.

   Global
      Specifies that the value is stored in the policy store and accessible by all Policy Servers sharing that policy store.

   Local
      Specifies that each Policy Server stores its own value.

   Managed
      Specifies that the value is managed by the product, not by XPS, and that the value is read-write.
Overrideable
Specifies that a value stored locally on a Policy Server can override a value stored globally on a shared policy store.

Read Only
Specifies that the value is both the default value and read only.

Export
Specifies whether the parameter is included in exports of the policy store.
_Type:_ Boolean

Report
Specifies whether the parameter is included in capabilities reporting for the Policy Server.
_Type:_ Boolean

RemoteAccess
Specifies what type of access the remote API has to the parameter:
None | Read | ReadWrite

Description
Describes the purpose of the parameter.

LicenseType
Specifies the type of license limit:
None | SoftLimit | HardLimit | ExpDate

None
Specifies that the parameter is not a license limit.

SoftLimit
Specifies that the parameter is a soft or advisory license limit.

HardLimit
Specifies that the parameter is a hard or absolute license limit.

ExpDate
Specifies that the parameter is the date on which the license expires.

Default Value
Specifies a default value for use when the current value is undefined.

_Note:_ If the default value is undefined, its value is specified according to its data type:

String
space
Number
  zero

Boolean
  FALSE

Visible
  Specifies whether the parameter is visible to XPSConfig.
  Type: Boolean

Syntax

XPSConfig has the following format:

XPSConfig [-vendor vendor] [-product product]
  [-?] [-vT | -vI | -vW | -vE | -vF]
  [-l log_path] [-e err_path] [-r rec_path]

Parameters

XPSConfig includes the following options:

-vendor
  (Optional) Specifies the name of the vendor whose data you want to view.

-product
  (Optional) Specifies the name of the product whose data you want to view.

-?
  (Optional) Displays help information for this utility.

-vT | -vI | -vW | -vE | -vF
  (Optional) Specifies when to log error information to the error file and how much information to log.

-vT
  Logs detailed information so that you can TRACE errors.

-vI
  Logs information in case there is an error.

-vW
  Logs error information in the event of a WARNING, ERROR, or FATAL error.
-vE
Logs error information in the event of an ERROR or FATAL error.

-vF
Logs error information in the event of a FATAL error.

-l
(Optional) Outputs logging information to the specified location.
Default: stdout

e
(Optional) Outputs error information to the specified location.
Default: stderr

-r
(Optional) Outputs a record of the session to the specified location.

**XPSEvaluate—Evaluate Expressions**

XPSEvaluate is an interactive command-line utility that allows administrators and application developers to evaluate expressions and test performance. To use XPSEvaluate, you must be an administrator with XPSEvaluate rights.

**Syntax**

XPSEvaluate has the following format:

```
XPSEvaluate [-np] [-trace] [-dbg debuglist]
[+ DB | formulapath] [+ contextpath] [+ u userpath] [-step]
[-?] [vT | vI | vW | vE | vF]
[-l log_path] [-e err_path] [-r rec_path]
```

**Parameters**

XPSEvaluate includes the following options:

- **-np**
  (Optional) Specifies no prompt.

- **-trace**
  (Optional) Turns on tracing.

- **-dbg**
  (Optional) Specifies the debug list.
-f
(Optional) Specifies the location of the named expressions.

Note: DB specifies the policy store.

-c
(Optional) Specifies the location of the context values.

-u
(Optional) Specifies the location of the user attributes.

-step
(Optional) Shows evaluation steps.

-?
(Optional) Displays help information for this utility.

-vT | -vI | -vW | -vE | -vF
(Optional) Specifies when to log error information to the error file and how much information to log.

-vT
Logs detailed information so that you can TRACE errors.

-vI
Logs information in case there is an error.

-vW
Logs error information in the event of a WARNING, ERROR, or FATAL error.

-vE
Logs error information in the event of an ERROR or FATAL error.

-vF
Logs error information in the event of a FATAL error.

-l
(Optional) Outputs logging information to the specified location.

Default: stdout

-e
(Optional) Outputs error information to the specified location.

Default: stderr

-r
(Optional) Outputs a record of the session to the specified location.
XPSEnator is an interactive command-line utility that allows an administrator or application developer to view the data in a policy store. When you export a subset of policy store data, you can use XPSEnator to locate the identifiers of the objects (XIDs) that you want to export. To use XPSEnator, you must be an administrator with XPSEnator rights.

Syntax

XPSEnator has the following format:

```
XPSEnator [-?] [-vT | -vI | -vW | -vE | -vF]
               [-l log_path] [-e err_path] [-r rec_path]
```

Parameters

XPSEnator includes the following options:

- `-?` (Optional) Displays help information for this utility.

- `-vT | -vI | -vW | -vE | -vF` (Optional) Specifies when to log error information to the error file and how much information to log.

  - `-vT` Logs detailed information so that you can TRACE errors.

  - `-vI` Logs information in case there is an error.

  - `-vW` Logs error information in the event of a WARNING, ERROR, or FATAL error.

  - `-vE` Logs error information in the event of an ERROR or FATAL error.

  - `-vF` Logs error information in the event of a FATAL error.

- `-l` (Optional) Outputs logging information to the specified location.

  **Default**: stdout
-e
(Optional) Outputs error information to the specified location.

Default: stderr

-r
(Optional) Outputs a record of the session to the specified location.

Export a Subset of Policy Store Data

To export a subset of policy store data, you need the identifiers of the objects (XIDs) that you want to export. You can use XPSExplorer to locate object identifiers. To use XPSExplorer, you must be an administrator with XPSExplorer rights.

In this use case, you export the following accounting applications:
- Accounts Payable
- Accounts Receivable
- General Ledger
- Payroll

Export a subset of policy store data
1. Open a command prompt on the machine hosting the Policy Server.
2. Enter the following command:
   XPSExplorer
   The main menu opens and lists vendors, products, and classes.
   Note: Only objects in top-level classes can be exported. Top-level classes are marked with asterisks.
3. Enter the number corresponding to the class of objects that you want to export.
   The Class Menu opens.
   Example: If the number 15 corresponds to accounting, enter 15.
4. Enter S to view the objects in the class.
   The Search Menu opens and the objects in the class are listed.
   Example Search Results:
   1-CA.SM::Accounting@0e-08c6cadb-e30b-4e06-9e2e-b3d7a866fab8
   (I) Name : "Accounts Payable"
   (C) Desc  : "accounts payable"
2-CA.SM::Accounting@0e-3b0f4ccf-71f3-4968-b095-2b5a830c3244
   (I) Name :  "Accounts Receivable"
   (C) Desc :  "accounts receivable"

3-CA.SM::Accounting@03-1c7ac22e-6646-4c61-8f2f-6261a0ef3a92
   (I) Name :  "General Ledger"
   (C) Desc :  "general ledger"

4-CA.SM::Accounting@10-8d78bb81-ae15-11d1-9cdd-006008aac24b
   (I) Name :  "Payroll"
   (C) Desc :  "payroll"

5-CA.SM::Accounting@@12-88f119a0-3fd1-46d0-b8ac-c1e83f00f97d
   (I) Name :  "Job Costing"
   (C) Desc :  "job costing"

**Example Object Identifiers (XIDs):**

CA.SM::Accounting@0e-08c6cadb-e30b-4e06-9e2e-b3d7a866fab8
CA.SM::Accounting@0e-3b0f4ccf-71f3-4968-b095-2b5a830c3244
CA.SM::Accounting@03-1c7ac22e-6646-4c61-8f2f-6261a0ef3a92
CA.SM::Accounting@10-8d78bb81-ae15-11d1-9cdd-006008aac24b
CA.SM::Accounting@@12-88f119a0-3fd1-46d0-b8ac-c1e83f00f97d

5. Enter Q three times to exit the Search, Class, and Main Menus and return to
   the command prompt.

6. Enter the following command at the command prompt:
   
   XPSExport output_file -xo object_XID_1 -xo object_XID_2
   -xo object_XID_3 -xo object_XID_4

   **output_file**
   
   Specifies the XML file to which the policy store data is exported.

   **-xo object_XID**
   
   Specifies the identifier of each object that you want to export.

   **Note:** You can copy the object identifiers (XIDs) from the Search results and
   paste them in the command line.
Example:

XPSExport accounting.xml
- xo CA.SM::Accounting@0e-08d6caadb-e03b-4e06-9e2e-b3d7a86f9ab8
- xo CA.SM::Accounting@0e-3b0f4ccf-71f3-496b-b095-2b5a830c3244
- xo CA.SM::Accounting@03-1c7ac22e-6646-4c61-8f2f-6261a0ef3a92
- xo CA.SM::Accounting@10-8d78bb81-ae15-11d1-9cdd-006008a0234

The policy store data for the specified accounting applications is exported to accounting.xml.

XCart Management

XPSExplorer includes the XCart feature. XCart allows you to collect the identifiers of the objects (XIDs) that you want to export and save them to a file for later use without manually copying and pasting each one. To use XPSExplorer, you must be an administrator with XPSExplorer rights.

To access XCart, enter X for XCart Management in the Main Menu of XPSExplorer. The XCart Menu opens and displays any objects that are in the XCart. The following options are context-sensitive and may or may not be displayed depending on the context:

C - Clear cart.
   Empties the XCart.

L - Load cart from file.
   ■ Initial load - Loads the XCart with the contents of the specified file and remembers the specified file name as the XCart file.
   ■ Subsequent loads - Adds the contents of the specified file to the XCart.
   Note: The name of the XCart file does not change.

S - Save cart to file: xcart_file
   Saves the contents of the XCart to the XCart file.

Important! The S command overwrites the contents of the XCart file without prompting first.

N - Save cart to new file.
   Saves the contents of the XCart to the specified file and remembers the specified file name as the XCart file.
   Note: The N Command prompts before overwriting the specified file.
Each object is tagged with an import mode that determines how it will be imported from the XPS file to the policy store:

**A - Set import mode to ADD.**
Adds new objects; does not replace existing objects.

**O - Set import mode to OVERLAY.**
Replaces existing objects; does not add new objects.

**R - Set import mode to REPLACE.**
Replaces existing objects and adds new objects.

**D - Set import mode to default.**
Specifies the default import mode.

*Note:* For each product class, there is a default import mode defined in the product's data dictionary.

**Q - Quit**
Exits the XCart Menu and returns to the Main Menu.

---

**Export a Subset of Policy Store Data Using XCart**

To export a subset of policy store data, you need the identifiers of the objects (XIDs) that you want to export. You can use the XCart feature of XPSEExplorerto locate objects and save them in an XCart file for later use when you export. For example, an administrator can set up an XCart file for members of operations to use as needed. To use XPSEExplorerto use XPSEExplorerto use XPSEExplorerto use XPSEExplorer, you must be an administrator with XPSEExplorerto use XPSEExplorer, you must be an administrator with XPSEExplorerto use XPSEExplorer, you must be an administrator with XPSEExplorer rights.

In this use case, you save the following four accounting applications in a file for later use:

- Accounts Payable
- Accounts Receivable
- General Ledger
- Payroll

**Export a subset of policy store data using XCart**

1. Open a command prompt on the machine hosting the Policy Server.
2. Enter the following command:

   ```
   XPSEExplorer
   ```

   The Main Menu opens and lists vendors, products, and classes.

   *Note:* Only objects in top-level classes can be exported. Top-level classes are marked with asterisks.
3. Enter X for XCart Management.
   The XCart Menu opens.

4. Create a text file.
   **Example:** C:\xcart\accounting.txt
   **Note:** This is where you want the contents of the XCart to be saved.

5. Enter L for Load cart from file.

6. Enter the path and name of the text file you created.
   The specified file name is remembered as the XCart file.
   **Example:** C:\xcart\accounting.txt
   **Note:** The file must exist. If not, L has no effect.

7. Enter Q to return to the Main Menu.

8. Enter the number corresponding to the class that you want to export.
   The Class Menu opens.
   **Example:** If the number 15 corresponds to Accounting, enter 15.

9. Enter S to view the objects in the class.
   The Search Menu opens and the objects in the class are listed.

**Example Search Results:**

1-CA.SM::Accounting@0e-08c6cadb-e30b-4e06-9e2e-b3d7a866fab8
   (I) Name : "Accounts Payable"
   (C) Desc : "accounts payable"

2-CA.SM::Accounting@0e-3b0f4ccf-71f3-4968-b09b-2b5a830c3244
   (I) Name : "Accounts Receivable"
   (C) Desc : "accounts receivable"

3-CA.SM::Accounting@03-1c7ac22e-6646-4c61-8f2f-6261a0ef3a92
   (I) Name : "General Ledger"
   (C) Desc : "general ledger"

4-CA.SM::Accounting@10-8d78bb81-ae15-11d1-9cdd-006008aac24b
   (I) Name : "Payroll"
   (C) Desc : "payroll"

5-CA.SM::Accounting@12-88f119a0-3fd1-46d0-b8ac-c1e83f00f97d
   (I) Name : "Job Costing"
   (C) Desc : "job costing"
10. For Accounting applications one through four:
   a. Enter the number corresponding to the application.
   b. Enter X for Add to XCart.
   c. Enter Q to exit the XCart Menu and return to the Search Menu.

   **Note:** An asterisk before an application indicates that it is in the XCart.

11. Enter Q twice to exit the Search and Class Menus and return to the Main Menu.

12. Enter X for XCart Management.

13. Enter S to Save the cart to the XCart file: C:\xcart\accounting.txt.

14. Enter Q twice to exit the XCart and Main Menus and return to the command prompt.

15. Enter the following command at the command prompt:

   \texttt{XPSExport output\_file \(-xf xcart\_file\)}

   \begin{itemize}
   \item \texttt{output\_file} specifies the XML file to which the policy store data is exported.
   \item \texttt{-xf xcart\_file} specifies the path and name of the XCart file containing the identifiers of the objects (XIDs) to export.
   \end{itemize}

   \textbf{Example:}

   \texttt{XPSExport accounting.xml C:\xcart\accounting.txt}

   The policy store data for the accounting applications saved in the XCart file is exported to accounting.xml.

\section*{Add an Application to an XCart File}

In this use case, you add a fifth accounting application, Job Costing, to the following four accounting applications already in the XCart file, accounting.txt, using the XCart feature of XPSExplorer:

- Accounts Payable
- Accounts Receivable
- General Ledger
- Payroll

\textbf{Note:} To use XPSExplorer, you must be an administrator with XPSExplorer rights.
Add an application to an XCart file

1. Open a command prompt on the machine hosting the Policy Server.
2. Enter the following command:
   
   XPSExplorer
   
   The Main Menu opens and lists vendors, products, and classes.
   
   **Note:** Only objects in top-level classes can be exported. Top-level classes are marked with asterisks.
3. Enter X for XCart Management.
   
   The XCart Menu opens.
4. Enter L for Load cart from file.
5. Enter the path and name of the existing text file containing the four accounting applications.
   
   The specified file name is remembered as the XCart file.
   
   **Example:** C:\xcart\accounting.txt
6. Enter Q to return to the Main Menu.
7. Enter the number corresponding to the class that you want added to the XCart file.
   
   The Class Menu opens.
   
   **Example:** If the number 15 corresponds to accounting, enter 15.
8. Enter S to view the objects in the class.
   
   The Search Menu opens and the objects in the class are listed.

**Example Search Results:**

1-CA.SM::Accounting@0e-08c6cadb-e30b-4e06-9e2e-b3d7a866fab8
   
   (I) Name : "Accounts Payable"
   (C) Desc : "accounts payable"

2-CA.SM::Accounting@0e-3b0f4ccf-71f3-4968-b095-2b5a830c3244
   
   (I) Name : "Accounts Receivable"
   (C) Desc : "accounts receivable"

3-CA.SM::Accounting@03-1c7ac22e-6646-4c61-8f2f-6261a0ef3a92
   
   (I) Name : "General Ledger"
   (C) Desc : "general ledger"
Note: An asterisk before an application indicates that it is in the XCart.

9. To add Job Costing to the XCart file:
   a. Enter 5 for the Job Costing application.
   b. Enter X for Add to XCart.
   c. Enter Q to exit the XCart menu and return to the Search Menu.
      The asterisk before the application indicates that it is in the XCart.
   d. Enter Q twice to exit the Search and Class Menus and return to the Main Menu.
   e. Enter X for XCart Management.
   f. Enter S to Save the XCart to the XCart file: C:\xcart\accounting.txt.
      Job Costing is added to accounting.txt.

10. Enter Q twice to exit the XCart and Main Menus and return to the command prompt.

XPSSecurity—Manage XPS Administrators

XPSSecurity is an interactive command-line utility that allows administrators and members of operations to create and delete administrators and edit their rights. To use XPSSecurity, you must be an administrator with XPSSecurity rights.

Syntax

XPSSecurity has the following format:

XPSSecurity[-?]|-vT | -vI | -vW | -vE | -vF

[+log_path][+err_path][+rec_path]

Parameters

XPSSecurity includes the following options:

-?

(Optional) Displays help information for this utility.
(Optional) Specifies when to log error information to the error file and how much information to log.

-\texttt{vT}

Logs detailed information so that you can TRACE errors.

-\texttt{vI}

Logs information in case there is an error.

-\texttt{vW}

Logs error information in the event of a WARNING, ERROR, or FATAL error.

-\texttt{vE}

Logs error information in the event of an ERROR or FATAL error.

-\texttt{vF}

Logs error information in the event of a FATAL error.

-\texttt{l}

(Optional) Outputs logging information to the specified location.

\textbf{Default:} stdout

-\texttt{e}

(Optional) Outputs error information to the specified location.

\textbf{Default:} stderr

-\texttt{r}

(Optional) Outputs a record of the session to the specified location.
Make an Administrator a Super User

A super user is defined when the connection to the external administrator store is configured. The super user is used to create and manage all other administrator accounts. If the super user is unavailable, use XPSSecurity to make any user in the external store a super user.

To make an administrator a super user

1. Log into the Policy Server host system with a SiteMinder administrator account that has XPSSecurity rights.
   
   **Note:** If an administrator with XPSSecurity rights is not available, you can log in as one of the following:
   
   - (Windows) the system administrator
   - (UNIX) root
   - the user who installed the Policy Server

2. Be sure that the XPSSecurity utility is located in `policy_server_home/bin`.

   `policy_server_home`

   Specifies the Policy Server installation path.

   **Note:** If the utility is not present, you can find it in the Policy Server installation media available on the Support site.

3. Open a command window and run the following command:

   `XPSSecurity`

   The main menu appears.

4. Type A and press Enter.

   The administrator menu lists the SiteMinder administrators in the external store. Each administrator is prefixed with a number.

5. Type the number of the administrator and press Enter.

   The administrator menu displays attributes specific to the administrator you chose. Each attribute is prefixed with a number.

6. Type 2 and press Enter.

   The administrator menu updates with flag settings.

7. Type a question mark (?) and press Enter.

   The Disabled and Super User flags appear. Each flag is prefixed with a number.

8. Type 2 and press Enter.

   The Super User flag is selected.
9. Type Q and press Enter.
   The administrator menu displays attributes specific to the administrator. The Flags attribute is set to Super User.

10. Type U and press Enter.
    The administrator record is updated.

11. Type Q and press Enter.
    The administrator menu lists the SiteMinder administrators in the external store. The administrator you chose appears as a super user.

12. Type Q and press Enter for the next two prompts to exit the utility.
    The administrator you chose is a super user. Use this administrator to restore modified or deleted permissions.

**XPSSweeper—Synchronize XPS and SiteMinder Policy Stores**

XPSSweeper is a command-line utility that can also be run as a batch job. You can use XPSSweeper to synchronize XPS and SiteMinder policy stores. Usually, XPS synchronizes the different policy stores. However, when legacy tools are used, the policy stores may need to be resynchronized using XPSSweeper. In any case, XPSSweeper does not harm the policy stores and can be run as a precaution.

**Syntax**

XPSSweeper has the following format:

```
XPSSweeper [-f] [-s seconds] [-m entries]
[?|vT | vI | vW | vE | vF]
[-l log_path] [-e err_path]
```

**Parameters**

XPSSweeper includes the following options:

- **-f**
  (Optional) Runs XPSSweeper in a loop forever.
  
  **Note:** Use Control-C to exit.

- **-s**
  (Optional) Sleeps for the specified number of seconds between iterations of XPSSweeper.
-m
(Optional) Outputs a milestone message every time the specified number of entries has been logged.

-?
(Optional) Displays help information for this utility.

-vT | -vI | -vW | -vE | -vF
(Optional) Specifies when to log error information to the error file and how much information to log.

-vT
Logs detailed information so that you can TRACE errors.

-vI
Logs INFORMATION in case there is an error.

-vW
Logs error information in the event of a WARNING, ERROR, or FATAL error.

-vE
Logs error information in the event of an ERROR or FATAL error.

-vF
Logs error information in the event of a FATAL error.

-l
(Optional) Outputs logging information to the specified location.
Default: stdout

-e
(Optional) Outputs error information to the specified location.
Default: stderr

Run XPSSweeper as a Batch Job

You can run XPSSweeper as a batch job by setting the following two XPS configuration parameters using XPSConfig:

**CA.XPS::$Autosweep**

Specifies whether to run XPSweeper according to the Autosweep schedule or not to run XPSSweeper at all.

Type: Boolean
CA.XPS::$AutosweepSchedule

Specifies the Autosweep schedule in GMT using the following format:

DDD@{HH:MM}[,...DDD@{HH:MM}]  

DDD  
(Optional) Specifies the day of the week:

Sun | Mon | Tue | Wed | Thu | Fri | Sat

HH  
Specifies the hour.  
**Range:** 00-23

MM  
Specifies the number of minutes past the hour.  
**Range:** 00-59

**Examples:**

Sun@08:30  
Every Sunday at 8:30am GMT

Tue@14:00  
Every Tuesday at 2:00pm GMT

15:15  
Everyday at 3:15pm GMT

Sun@08:30,Tue@14:00,15:15  
Every Sunday at 8:30am, every Tuesday at 2:00pm, and everyday at 3:15pm except Tuesday

**Note:** Multiple Autosweep times can be separated by commas, spaces, or semicolons.

Policy Servers manage XPSSweeper Autosweep times as follows:

- XPSSweeper may run a few minutes off schedule because the cache check frequency is every several minutes.
- If XPSSweeper is already running when it is scheduled to run, it is not stopped and restarted, but allowed to finish the sweep process.
- XPSSweeper is not run more frequently than every two hours, even when scheduled.

**Example:** If XPSSweeper is scheduled to run at 2:00pm on Tuesday and daily at 3:15pm, the latter sweep is not run on Tuesdays.
Configure Autosweep Using XPSConfig

In this use case, you configure XPSSweeper to run nightly at 10:00pm GMT. To do so, you set the following two XPS configuration parameters using XPSConfig:

- CA.XPS::$Autosweep
- CA.XPS::$AutosweepSchedule

To configure Autosweep using XPSConfig

1. Open a command prompt on the machine hosting the Policy Server.
2. Enter the following command:
   
   ```command
   XPSConfig
   ```
   
   The Products Menu opens and lists the products.
3. Enter XPS for Extensible Policy Store.
   
   The Parameters Menu opens and lists the XPS parameters.
4. Enter 7 for Autosweep.
   
   The Autosweep Parameter Menu opens.
5. Verify that the Autosweep value is set to TRUE or enter C to Change the value to TRUE.
   
   **Note**: This step specifies running XPSSweeper according to the Autosweep Schedule.
6. Enter Q to exit the Autosweep Menu and return to the Parameters Menu.
7. Enter 8 for AutosweepSchedule.
   
   The AutosweepSchedule Parameter Menu opens.
8. Enter C to Change the value of the AutosweepSchedule parameter.
9. Enter 22:00 for the New Value.
   
   **Note**: This step specifies running XPSSweeper nightly at 10:00pm GMT.
10. Enter Q three times to exit the AutosweepSchedule Menu, Parameters Menu, and Products Menu and return to the command prompt.
Appendix A: SiteMinder and CA Security Compliance Manager

This section contains the following topics:

How SiteMinder and CA Security Compliance Manager Integration Works (see page 213)
Generate the Compliance Reports (see page 214)
Display List of Available Compliance Reports Or Their Fields (see page 215)

How SiteMinder and CA Security Compliance Manager Integration Works

CA SiteMinder has a command-line tool, smcompliance, which creates compliance reports that you can manually import into CA Security Compliance Manager. The smcompliance tool generates the following types of reports by default:

**Policies**

Lists all of the policies stored in the SiteMinder Policy Server from which the command was run.

**User Directory**

Lists all of the user directories in the policy store that is associated with the Policy Server.

**User Resources**

Lists the users, their respective user directories and any associated policies.

To export SiteMinder compliance data to CA Security Compliance Manager, use the following process:

1. (Optional) Update the configuration file for the compliance tool if you want to do any of the following:
   - Change the report name or field names in an existing report.
   - Add a new report.
   - Delete a report.
2. Generate the reports by running the compliance tool on the Policy Server.
3. Send the generated reports to the CA Security Compliance Manager administrator in your organization.
Generate the Compliance Reports

The SiteMinder compliance reports for CA Security Compliance Manager are generated with a command line tool. After the reports are generated, you must send them to the CA Security Compliance Manager administrator in your organization so they can be imported into CA Security Compliance Manager.

To generate the compliance reports
1. Open a command line window on the machine which hosts the Policy Server.
2. Run the smcompliance command with any of the following options:

   - **-dir directory_name**
     Specifies the full path to an output directory where the generated reports will be saved. If this directory already exists, the tool renames the existing directory as a backup.
     **Default:** `siteminder_home/compliance/output`

   - **-conf configuration_file**
     Specifies the full path to the configuration file that determines the content and format of the reports. The default configuration file has the content for CA Security Compliance Manager, but you can customize a configuration file to meet your needs.
     **Default:** `siteminder_home/compliance/config`

   - **-log log_file**
     Specifies the full path to a log file.
     **Default:** `siteminder_home/compliance/output`

   - **-format format_type**
     Specifies one of the following file types for the reports:
     - **CSV** (comma-separated value) file.
     - **XML** file
     **Default:** csv

The reports and log file are generated. The files are ready to send to the CA Security Compliance Manager administrator.
Display List of Available Compliance Reports Or Their Fields

The SiteMinder compliance-report tool, smcompliance, can generate other types of reports in addition to those reports produced by default.

To display a list of available compliance reports
1. Open a command prompt on the Policy Server.
2. Enter the following command:
   `smcompliance -help reports`
   A list of report names appears.
3. (Optional) To see what fields a report contains, enter the following command:
   `smcompliance -generate report_name`
   The *report_name* must match a name from the list in Step 2. For example, to see what fields the agents report contains, enter the following:
   `smcompliance -generate agents`
   A list of fields for the report appears in XML format. You can add the XML to a configuration file to produce a new report.
Add a New Compliance Report

You can generate other types of compliance reports by adding new reports to the configuration file used by the smcompliance tool.

To add a new compliance report

1. Verify the name of the report you want to add displaying a list of available compliance reports with the smcompliance tool.
2. Display the fields of the report you want to add, then copy the xml-formatted text from the screen.
3. Navigate to the following directory on the Policy Server.
   
   siteminder_home\compliance\config
   
4. Open the default configuration file, compliance.conf, with a text editor.
5. Save a copy of the default file using a different name.
6. Copy an existing <report> section and paste it above the </reports> tag at the bottom of the configuration file.
7. Remove the existing text between the <columns> tags.
8. Add the text from Step 2 between the <columns> tags.
9. Replace the value of the name attribute in the <report> tag with the name of the report from Step 1.
10. Change the value of the name attribute in the <table> tag to describe the new report. The generated report file uses this name.
11. Save your changes and close the new configuration file.

The new report is added.
12. Run the smcompliance command and specify the new configuration file.
Change the Content of the Existing Compliance Reports

The reports generated by the default configuration file provide the typical compliance information that CA Security Compliance Manager needs. If your organization has different needs, you can create your own custom configuration file to generate reports with the information you want.

1. Navigate to the following directory on the Policy Server.

   `siteminder_home/compliance/config`

2. Open the default configuration file, compliance.conf, with a text editor.

3. Save a copy of the default file using a different name.

4. Make any of the following changes to the new copy of the configuration file:

   - To remove a report, look between the `<report>` and `</report>` tags for the report that you want to remove, and then delete the section and the tags.
   - To change the name of a report, modify the value of the name attribute in the `<table>` tag.
   - To change the name of a field in a report (not the information it contains), modify the value of the name attribute in the `<column>` tag.
   - Move any columns you want to add from `<comment>` section in the configuration file to the `<columns>` section.
Appendix B: General SiteMinder Troubleshooting

This section contains the following topics:

- Command Line Troubleshooting of the Policy Server (see page 219)
- Check the Installed JDK Version (see page 224)
- Override the Local Time Setting for the Policy Server Log (see page 225)
- Review System Application Logs (see page 225)
- LDAP Referrals Handled by the LDAP SDK Layer (see page 225)
- Idle Timeouts and Stateful Inspection Devices (see page 228)
- Error -- Optional Feature Not Implemented (see page 229)
- Errors or Performance Issues When Logging Administrator Activity (see page 230)
- Troubleshoot Policy Server Console Help on Netscape Browsers (see page 230)
- Event Handlers List Settings Warning when Opening Policy Server Management Console (see page 230)
- SiteMinder Policy Server Startup Event Log (see page 231)

Command Line Troubleshooting of the Policy Server

You can run the Policy Server process interactively in a separate window with debugging options turned on to troubleshoot problems. The following server executable may be run from the command line:

```
install_dir/siteminder/bin/smpolicysrv
```

**Note:** On Windows systems, do not run the smpolicysrv commands from a remote desktop or Terminal Services window. The smpolicysrv command depends on inter-process communications that do not work if you run the smpolicysrv process from a remote desktop or Terminal Services window.

Use the following options with the smpolicysrv command:

- **-tport_number**
  
  This option is used to modify the TCP port that the server binds to for Agent connections. If this switch is not used, the server defaults to the TCP port specified through the Policy Server Management Console.

- **-uport_number**
  
  This option is used to modify the UDP port that the server binds to for RADIUS connections. If this switch is not used, the server defaults to the UDP port specified through the Policy Server Management Console. This switch is applicable to the authentication and accounting servers only.
- **stop**
  This switch stops the server in the most graceful manner possible. All database and network connections are closed properly using this method.

- **abort**
  This switch stops the server immediately, without first closing database and network connections.

- **stats**
  This switch produces current server runtime statistics such as thread pool limit, thread pool message, and the number of connections.

- **resetstats**
  This switch resets the current server runtime statistics without restarting the Policy Server. This switch resets the following counters:
  - Max Threads is reset to the Current Threads value.
  - Max Depth of the message queue is reset to the Current Depth of the message queue.
  - Max Connections is reset to Current Connections.
  - Msgs, Waits, Misses, and Exceeded limit are reset to zero.
  This switch does not reset the following counters:
  - Thread pool limit
  - Current Threads
  - Current Depth of the message queue
  - Current Connections
  - Connections Limit

- **publish**
  Publishes information about the Policy Server.

- **tadmport_number**
  Sets the TCP port for the administration service.

- **uacport_number**
  Sets the UDP port for Radius accounting.

- **uadmport_number**
  Sets the UDP port for the administration service.

- **uauthport_number**
  Sets the UDP port for Radius authentication.
-ac
  Enables the servicing of Agent API requests.

-noac
  Disables the servicing of Agent API requests.

-adm
  Enables the servicing of administration requests.

-noadm
  Disables the servicing of administration requests.

-radius
  Enables the servicing of RADIUS requests.

-noradius
  Disables the servicing of RADIUS requests.

-onlyadm
  Combines the following options into a single option:
  ■ -adm
  ■ -noac
  ■ -noradius

-starttrace
  The command:
  ■ starts logging to a trace file and does not affect trace logging to the console.
  ■ issues an error if the Policy Server is not running.

If the Policy Server is already logging trace data, running the -starttrace command causes the Policy server to:
  ■ rename the current trace file with a time stamp appended to the name in the form: file_name.YYYYMMDD_HHmmss.extension
  ■ create a new trace file with the original name

For example, if the trace file name in Policy Server Management Console’s Profiler tab is C:\temp\smtrace.log, the Policy Server generates a new file and saves the old one as C:\temp\smtrace.20051007_121807.log. The time stamp indicates that the Policy Server created the file on October 7, 2005 at 12:18 pm. If you have not enabled the tracing of a file feature using the Policy Server Management Console’s Profiler tab, running this command does not do anything.
-**stoptrace**

The command:
- stops logging to a file and does not affect trace logging to the console.
- issues an error if the Policy Server is not running.

You can use two `smpolicysrv` command line options, `-dumprequests` and `-flushrequests`, to troubleshoot and recover more quickly from an overfull Policy Server message queue. Only use these options in the following case:

1. Agent requests waiting in the Policy Server message queue time out.
2. One or more Agents resend the timed-out requests, overfilling the message queue.

!!Important Do not use `-dumprequests` and `-flushrequests` in normal operating conditions.

-**dumprequests**

Outputs a summary of each request in the Policy Server message queue to the audit log.

-**flushrequests**

Flushes the entire Policy Server message queue, so that no requests remain.
**Start or Stop Debugging Dynamically**

You can start or stop the debugging function of certain components at any time without restarting the Policy Server.

**Note:** We recommend using this feature only when directed to do so by CA technical support personnel.

**To start or stop debugging dynamically**

1. Open a command window on the machine hosting the Policy Server.
2. Type the following command:
   
   `smcommand -i SiteMinder`

   A list of options appears.
3. Select one of the following debugging options according to the instructions given by your CA support representative.

   **CA.EPM::EPMObjects_Debug**
   Toggles the debugging state of the SiteMinder EPM component.

   **CA.XPS::Debug**
   Toggles the debugging state of the SiteMinder XPS component.

   **CA.XPS::XPSEval_Debug**
   Toggles the debugging state of the SiteMinder XPSEvaluate component.
Start or Stop Tracing Dynamically

You can start or stop the tracing functions of certain components at any time without restarting the Policy Server.

To start or stop tracing dynamically
1. Open a command window on the machine hosting the Policy Server.
2. Type the following command:
   
   `smcommand -i SiteMinder`

3. A list of options appears. The tracing options display the opposite of their current states. For example, if tracing for CA XPS is currently disabled, the option to turn it on appears as follows:

   `item_number-CA.XPS::TraceOn`

4. Select one of the following options by typing the number of the option you want:

   **CA.EPM::EPMObjects_TraceState**
   Toggles tracing for the EPM Objects components on or off.

   **CA.XPS::TraceState**
   Toggles tracing for the CA XPS components on or off.

   **CA.XPS::XPSEval_TraceState**
   Toggles tracing for the XPS Expression Evaluator components on or off.

   A confirmation message appears. The list of options is re-displayed with your changes.

5. (Optional) Repeat Step 4 to start or stop tracing on another component.

6. Type Q to quit.

   Tracing has been changed dynamically.

Check the Installed JDK Version

If a Policy Server fails to start, check that the correct version of the JDK is installed.
Override the Local Time Setting for the Policy Server Log

The Policy Server log file, `install_dir/siteminder/log/smps.log`, displays time in local timezone as identified by the operating system of the machine on which the Policy Server is installed.

To display the time in this log file in GMT time:

1. Locate the following registry setting:
   
   ```plaintext
   HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\LogConfig\LogLocalTime
   ```
   
2. Change the value from 1 (which is the default) to 0.

Review System Application Logs

If the Policy Server fails to start, review the event log (on Windows) or the syslog (on UNIX) for information about the Policy Server.

- On Windows, view the event log using the Event Viewer. From the Log menu of the Event Viewer, select Application.
- On UNIX, view the syslog using a text editor.

LDAP Referrals Handled by the LDAP SDK Layer

Enhancements have been made to SiteMinder’s LDAP referral handling to improve performance and redundancy. Previous versions of SiteMinder supported automatic LDAP referral handling through the LDAP SDK layer. When an LDAP referral occurred, the LDAP SDK layer handled the execution of the request on the referred server without any interaction with the Policy Server.

SiteMinder now includes support for non-automatic (enhanced) LDAP referral handling. With non-automatic referral handling, an LDAP referral is returned to the Policy Server rather than the LDAP SDK layer. The referral contains all of the information necessary to process the referral. The Policy Server can detect whether the LDAP directory specified in the referral is operational, and can terminate a request if the appropriate LDAP directory is not functioning. This feature addresses performance issues that arise when an LDAP referral to an offline system causes a constant increase in request latency. Such an increase can cause SiteMinder to become saturated with requests.
Disable LDAP Referrals

If LDAP referrals are causing errors, you can disable all LDAP referrals. Note that disabling LDAP referrals will cause any referrals in your directory to return errors.

To disable LDAP referral handling for Policy Servers on Windows

1. From the Windows Start menu, select Run.
2. Enter regedit in the Run dialog box and click OK.
3. In the Registry Editor, navigate to:
   HKEY_LOCAL_MACHINE
       \SOFTWARE\Netegrity\SiteMinder\CurrentVersion\Ds\LDAPProvider
4. Modify the following registry value:
   
   **Note:** The value is shown in hexadecimal notation.
   
   "EnableReferrals"=dword:00000001

   Determines if any LDAP referrals are handled by the Policy Server. If set to 0, no LDAP referrals will be accepted by the Policy Server. If set to 1, the Policy Server accepts LDAP referrals.

   LDAP referrals are enabled by default. This setting may only be modified by editing the Registry.

5. Restart the Policy Server.

To disable LDAP referral handling for a Policy Server on Solaris

1. Navigate to:
   install_dir/siteminder/registry
2. Open sm.registry in a text editor.
3. Locate the following text in the file:
   HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\Ds\LDAPProvider
4. Locate the line that follows the line from step 3 and begins with:

   EnableReferrals

5. Modify the value that comes just before the semicolon as follows.

   **Note:** The value must be converted to hexadecimal notation.

   Determines if any LDAP referrals are handled by the Policy Server. If set to 0, no LDAP referrals will be accepted by the Policy Server. If set to 1, the Policy Server accepts LDAP referrals.

6. Restart the Policy Server.
Handle LDAP Referrals on Bind Operations

To configure LDAP referrals on bind operations for Policy Servers on Windows

1. From the Windows Start menu, select Run.
2. Enter regedit in the Run dialog box and click OK.
3. In the Registry Editor, navigate to:
   
   HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\Ds\LDAPProvider

4. Modify the following registry value:
   
   "ChaseReferralsOnBind"=dword:00000001

   **Note:** The value is shown in hexadecimal notation.

   Determines if LDAP referrals on a bind operation should be chased. Most LDAP directory servers handle LDAP referrals on binds. If your directory server handles referrals on binds, ChaseReferralsOnBind has no effect. However, if your directory does not, this setting allows the Policy Server to handle bind referrals.

   If your server does handle referrals on bind operations you can change this setting to 0, disabling the Policy Server’s ability to handle bind referrals.

   Referral chasing on binds is enabled by default. This setting may only be modified by editing the Registry.
5. Restart the Policy Server.

To configure LDAP referrals on bind operations for a Policy Server on Solaris

1. Navigate to:

   `install_dir/siteminder/registry`

2. Open sm.registry in a text editor.

3. Locate the following text in the file:

   HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\Ds\LDAPProvider

4. Locate the line that follows the line from step 3 and begins with:

   ChaseReferralsOnBind
5. Modify the value that comes just before the semicolon as follows.

   **Note:** The value must be converted to hexadecimal notation.

   Determines if LDAP referrals on a bind operation should be chased. Most LDAP directory servers handle LDAP referrals on binds. If your directory server handles referrals on binds, ChaseReferralsOnBind has no effect. However, if your directory does not, this setting allows the Policy Server to handle bind referrals.

   If your server does handle referrals on bind operations you can change this setting to 0, disabling the Policy Server’s ability to handle bind referrals.

6. Restart the Policy Server.

---

**Idle Timeouts and Stateful Inspection Devices**

Stateful inspection devices, such as firewalls, generally have an idle timeout setting. SiteMinder connections from Policy Servers to Agents also have idle timeout settings.

The Policy Server polls the services at a regular interval. The polling interval has a 5-minute cap. This means the idle connections will time out within 5 minutes of the configured value. For example, if the value 55 minutes is specified as the timeout, then the connections will time out between 55 and 60 minutes.

By default, connections created between a Policy Server and a Web Agent expire after 10 minutes of inactivity. If a firewall or other stateful network device exists between a Policy Server and a Web Agent and connections are idle for longer that the device’s idle timeout, then the device ends those connections without notifying either the Policy Server or the Web Agent.

When the Web Agent attempts to use a connection that has been terminated by a network device, it receives a network error, resets the connection, and reports a 500 error (20-0003) to the browser. The Agent also closes all other connections in the connection pool that are the same age or older than the one that received the error. On the Policy Server side, however, the sockets for those connections remain established. Depending on the load patterns for the site, connection growth can occur to a point that it interferes with the proper operation of the Policy Server.
To prevent a firewall or other stateful network device from terminating Policy Server – Web Agent connections, you must configure an idle timeout for Policy Server. When the Policy Server closes a TCP/IP connection, it will wait for a specified period of inactivity and then send RESET, closing the server and client ends of the connection cleanly. The period of inactivity is specified in the Idle Timeout (minutes) field on the Settings tab of the Policy Server Management Console.

**Note:** The Idle Timeout (minutes) field can also be used to limit the amount of time an administrator may be connected.

At installation, the Idle Timeout value is set to 10 minutes. To work with a stateful network device, set the value to a shorter time period than the TCP/IP idle timeout of the device that is located between the web agent and the policy server. It is recommended that the TCP Idle Session Timeout be set to 60% of the idle timeout of any stateful device(s) to ensure that the Policy Server’s timeout occurs first.

---

**Error -- Optional Feature Not Implemented**

When the Policy Server attempts to use an ODBC data source, but cannot connect to the database, the following error message may appear:

```plaintext
Optional feature not implemented. Error code -1
```

Often this message indicates a component mismatch, a misconfiguration or invalid credentials.

**Note:** CA's configuration of the Intersolv or Merant drivers differs from the default configuration.

If you receive the above message, and you are using an ODBC data source as your policy store, or for logging, see the sections that describe the configuration of ODBC data sources in the *Policy Server Installation Guide*. 
Errors or Performance Issues When Logging Administrator Activity

On the Audit tab of the Policy Server Management Console, if you have set Administrator Changes to Policy Store Objects to Log All Events, and you are logging to an ODBC data source, you may encounter one of the following:

- Substantial delays when saving objects in the Administrative UI
- The error message:
  
  > Exception occurred while executing audit log insert.

If either of these conditions occur, log to a text file instead.

Troubleshoot Policy Server Console Help on Netscape Browsers

If Netscape 4.7 (or earlier) is your default browser on Windows, you may have a problem starting the help. If you start the help while no Netscape window is open, you receive an error message.

However, the correct help still appears and works properly. If you start the help while a Netscape window is already open, the Help does not appear.

Both symptoms can be addressed by upgrading Netscape to a more recent version or by making Internet Explorer the default browser.

The problems do not occur for Netscape on UNIX.

Event Handlers List Settings Warning when Opening Policy Server Management Console

**Symptom:**

When I log into the Policy Server Management Console for the first time after upgrading to SiteMinder r12.0 SP2, a warning message appears saying that the event handlers list should be set to XPSAudit.

**Solution:**

For SiteMinder r12.0 SP2, you can no longer add custom event handler libraries using the Policy Server Management Console. Use the XPSConfig command-line tool to add any custom event-handler libraries.
SiteMinder Policy Server Startup Event Log

More information:
Add Event Handler Libraries (see page 90)

SiteMinder Policy Server Startup Event Log

Symptom:
My Policy Server crashed while it was starting up. I want to know what SiteMinder startup events occurred before the Policy Server crashed.

Solution:
If the Policy Server crashes on startup, a log of the startup events is stored in the following file:

policy_server_home/audit/SmStartupEvents.audit
Appendix C: Scaling Your SiteMinder Environment

This section contains the following topics:

- Manage Agent Keys in Large Environments (see page 233)
- How to Determine When to Add Web Agents (see page 234)
- How to Determine When to Add Policy Servers (see page 241)
- Netscape LDAP Directory Tuning (see page 250)
- Replication Considerations (see page 251)
- UNIX Server Tuning (see page 251)
- Timezone Considerations (see page 252)

Manage Agent Keys in Large Environments

Agent keys are used by Web Agents to encrypt and decrypt cookies passed to a user’s browser. The value of an Agent key is initially set by the Policy Server when the Policy Server receives its first request from a Web Agent. The key is then used by the Web Agent to encrypt the contents of cookies it passes to the user’s browser. All Web Agents in a SiteMinder deployment must be set to the same value to participate in a single sign-on environment.

Changing the value of Agent keys on a regular basis provides the strongest security. If keys are updated on a regular basis, a key that may have lost its integrity would only be in use for a minimal amount of time.

The challenge of managing Agent keys in large organizations is that all Agent keys must be updated simultaneously. If the Agent keys in a SiteMinder installation are not all identical, communication between multiple Web Agents using single sign-on cookies cannot take place.

To address the challenge of changing all keys simultaneously, the Policy Server provides dynamic Agent key rollover. When the Policy Server is configured to use this feature, the Policy Server generates an Agent key dynamically and distributes the key to associated Web Agents. If the Web Agents are configured to work with multiple Policy Servers, new Agent keys are pushed out to these other Policy Servers in the SiteMinder installation, as well.

**Note:** Session timeouts must be less than two times the interval between Agent key rollovers. If a session timeout is not less than twice the interval, users may be challenged for credentials before their sessions terminate. For information about session timeouts, see the *Web Agent Configuration Guide*. 
How to Determine When to Add Web Agents

To ensure the best performance of SiteMinder, the installation should have an adequate number of Web servers (hosting Web Agents) to support user requests. If there are not enough Web servers/Web Agents in place, users may face a delay in service if the Web servers operate under heavy loads of users. In the worst scenario, users will not be able to log in at all if their request to log in times out before being received by the Policy Server. Therefore, it is important to add more Web servers and Web Agents to the environment as user and resource requirements grow.

Estimate User Requests

There are several ways to estimate how many users a Web Agent supports:

- Generate a SiteMinder Activity report for each Web Agent in the installation. This report provides information about the time, user, category of activity, denials, failures, and a brief description of the activity.
- Generate an activity report for the Web server. For more information, see your Web server documentation.

Determine the Number of Users the Web Agent Can Support

The number of concurrent users a Web Agent can support depends on several factors, including the number of TCP/IP sockets the Web Agent has available. Other factors that affect the number of users a Web Agent can support include:

- The amount of memory available to the Web Agent’s Web Server
- The processor speed of the Web Agent’s Web Server
- How cache is configured
How Requests are Handled

When a user request, such as a GET, PUT, or POST, is received by a Web Agent, the Web Agent forwards the request to the Policy Server. The Web Agent uses multiple threads to provide high performance processing of many requests. The Policy Server must provide enough sockets (one for each thread) to support communication with the Web Agent.

The Policy Service combines the Authentication, Authorization, and Accounting functions into one service that listens, by default, on port 44443 for Web Agent requests. By default, a Web Agent requires two sockets to communicate with the Policy Server on port 44443.

Note: The Policy Server Management Console lists the default ports of 44442, 44443, and 44441 for Authentication, Authorization, and Accounting, respectively, for 5.x Web Agent mixed-mode compatibility with the Policy Server. A 5.x Web Agent opens sockets across all three ports to communicate with a Policy Server service.

The total number of sockets used by the Web Agent is one factor you must consider when determining how many Web Agents a Policy Server can support. More information exists in How to Determine When to Add Policy Servers (see page 241).
When the load requirements increase as more users attempt to access the resource protected by the Web Agent, the Web Agent uses more socket connections for each port. By default, the maximum number of socket connections that the Web Agent can sustain through port 4443 is 20.

Maximum Available Sockets for a Web Agent

By default, each Web Agent can sustain 20 sockets to each of the Policy Server. If the number of requests exceeds the open sockets at any given time, requests are placed in a queue.

How the Queue Works

The queue is designed to hold a maximum of 300 requests. For example, if the default Web Agent configuration values were not modified, 20 requests could be sent to the Policy Server at once. An additional 300 requests could then be placed in a queue. Therefore, using the default settings, the Web Agent could support 320 requests at any given moment.

By caching user information, Web Agents can support more than 320 requests at any given moment, even if you do not modify the default configuration options. However, in almost all deployments, far fewer than 320 simultaneous requests are required between a single Web Agent and the Policy Server.
Once placed in a queue, requests remain pending until one of the following takes place:

- A socket is made available and the request is sent to the Policy Server.
- The request times out.

**Increase the Request Timeout**

If the amount of time allocated for the request expires, the request is removed from the queue, and the user must re-attempt to access the resource. To avoid this situation when a Web Agent is experiencing a heavy load, the request timeout setting should be set to a greater amount of time. This value is defined in the Host Configuration Object which resides on the Policy Server. The default value is 60 seconds (60000 milliseconds).

**Increase the Available Sockets for Web Agents**

To handle a heavier load of requests, you can increase the default maximum number of sockets that the Web Agent can sustain for the port. The value is defined by the MaxSocketsPerPort setting in the Host Configuration Object.

**Configure Web Agents Under Heavy Loads**

For Web Agents in environments where there is heavy traffic between the Web Agents and the Policy Servers, modify the appropriate configuration settings identified below in the Host Configuration Object.

**Sockets Usage**

In this section, connections discussed are from the Web Agent to the Policy Server service listening on the default port of 44443. Therefore, if nofiles(descriptors) is set to 1024, that means that the Policy Server service has 1024 file descriptors available.

Netscape / Sun Java Systems web servers are assumed to be configured for the default of single-process mode (MaxProcs set to 1). Sun Java Systems (formerly iPlanet) v6 runs in multi-process mode by default.

**Sockets and IIS/Sun Java Systems Web Agents**

For Web Agents installed on IIS or Sun Java Systems Web Servers, the MinSocketsPerPort and MaxSocketsPerPort settings, in the host configuration object, determine the minimum and maximum number of sockets that will be open from the Web Agent to the Policy Server. When the Web server, with an installed and enabled SiteMinder Web Agent, starts, the Agent opens the number of sockets specified by the MinSocketsPerPort setting as defined in the host configuration object for the Agent.
As load increases, the number of sockets also increases, up to the number of sockets specified in the MaxSocketsPerPort setting in the host configuration object. If the Web Agent receives more requests than the number specified in MaxSocketsPerPort, then the overflow requests are placed in a queue.

*Note:* The queue for overflow requests has a limit of 300.

Each request uses a socket, but not all requests open new sockets. If all sockets from the connection pool are in use, then the Agent opens additional sockets as needed. New sockets are opened in groups defined by the number specified in the newsocketstep setting of the host configuration object. The Agent will continue to open new sockets as needed until the maximum limit specified in the MaxSocketsPerPort setting is reached. Only a single request can be executed on a socket, meaning that a socket is utilized until a reply comes back from the Policy Server. Once a request is completed, the socket is placed into a connection pool so that it can be used to service another request.

Once a socket is opened, it will not be closed. Exceptions include communication errors between the Agent and the Policy Server, and the idling out of connections by the Policy Server. Socket(s) will be closed by the Policy Server if they are unused for the length of time specified by the TCP Idle Session Timeout for the associated service (specified in the Policy Server Management Console).

**Sockets and Apache Web Agents**

Unlike the other Agents, Apache Web Agents do not use connection pooling. Apache is multi-processed and has a drastically different architecture from IIS and iPlanet Web servers, which are multi-threaded. Apache spawns child processes to handle requests, and uses a configuration setting called MaxClients to determine the maximum number of child processes that it will fork to handle load. The number of child processes is managed by Apache settings in the httpd.conf file. Each child process has its own independent socket connection(s) to the Policy Server. When the Apache parent process forks a child, an initial connection is opened to each Policy Server for the default Agent. The total number of sockets opened from an Apache server at maximum will equal the value of MaxClients times the number of trusted hosts.

*Note:* This connection model may have major implications for the Web Agent to Policy Server ratio (depending on the version of the Policy server being used), as the limiting factor often becomes connections between the agent and Policy Server, rather than the number of transactions per second. Before deploying Web Agents on Apache, it is very important to ensure that the Policy Server can handle the maximum number of connections that may be opened by all Web Agents that connect to it.

**More information:**

[Sample Calculations for Sockets and Maximum Connections](#) (see page 248)
Increase the Number of Sockets per Port

If the number of user requests will exceed 60 (20 requests being processed and 40 requests in queue) at any given moment, increase the Web Agent’s MaxSocketsPerPort setting to a more suitable value. However, if you have multiple Trusted Hosts in the SiteMinder installation, and you increase the Max Sockets Per Port value for each Trusted Host, you may need to modify the Max Sockets setting in the Policy Server Management Console (Settings tab), as well.

More information:

How to Determine When to Add Policy Servers (see page 241)

Configure Dynamic Load Balancing or Failover

If the Web Agent works with multiple Policy Servers, configure dynamic load balancing to let the Web Agent distribute requests across all of the Policy Servers. Dynamic load balancing provides faster access to Policy Servers and therefore, more efficient user authentication and authorization.

Failover and load balancing considerations differ based on the type of Web server on which you install your Web Agents.

Failover/LoadBalancing for IIS or Sun Java Systems Web Agents

If you configure your environment for failover or load-balancing between Policy Servers, then the Web Agent opens the minimum number of sockets to each Policy Server at startup. Connections to a load-balanced Policy Server occur in the same way as connections to a single Policy Server, although fewer sockets may be opened to each Policy Server, since each is getting half of the total requests.

If configured for failover, and an error occurs between the Web Agent and the primary Policy Server, then connections to the failover Policy Server will be used. Failover occurs per service, so there may be active connections to both the primary and the failover Policy Servers at once. Once the primary Policy Server comes back up, the sockets opened to the failover server remain. All new sockets will be opened to the primary Policy Server. Failover is inherently part of load balancing; if one of the load balancing Policy Servers becomes unavailable, normal failover takes place.
Failover/LoadBalancing for Apache Web Agents

The Apache agent opens the same number of connections to all configured Policy Servers, whether or not failover has occurred. Since each child process has its own connection(s) to the Policy Server, failover occurs independently for each child. This can result in a 500 error for each socket as failover takes place. Once the primary Policy Server comes back up, the sockets opened to the failover server remain. All new sockets will be opened to the primary Policy Server. Failover is inherently part of load balancing; if one of the load balancing Policy Servers becomes unavailable, normal failover takes place.

Increase the Request Timeout

Modify the default value of 60000 milliseconds (60 seconds) if the network connections are slow or you expect a large number of users.

Note: Cache can also be increased to improve Web Agent performance, however, increasing cache is usually more appropriate for sites that are not experiencing a large number of policy changes, as described in the section below.

Improve Performance in More Stable Environments

For environments that are not subject to frequent policy changes, you can modify the following configuration parameters. Changing these values will improve performance by decreasing the amount of communication between Web Agents and Policy Servers. Therefore, Web Agents will not retrieve information about policy changes on a frequent basis.

Decrease the Policy Server Poll Interval

This parameter field determines how often the Web Agent retrieves information about policy changes from the Policy Server. A higher interval decreases traffic between the Policy Server and Web Agent. By default, the Web Agent polls the Policy Server every 30 seconds.

Modify the Maximum User Session Cache Size

This parameter specifies the size of the user cache, in megabytes, where the Web Agent caches information about authenticated users. When the cache fills to capacity, the Web Agent replaces the oldest user in the cache with a new user. The size of the cached information for each user entry will vary depending on resource usage requirements. You can increase performance by increasing the size of the cache according to your system’s available memory.
Increase the Resource Cache Timeout

This parameter specifies the amount of time that resource entries remain in the cache. After the timeout expires, the Web Agent removes cached entries and contacts the Policy Server if the user attempts to access the protected resource again. By default, this value is set at 600 seconds (10 minutes).

How to Determine When to Add Policy Servers

Each Policy Server in the SiteMinder environment must have adequate resources to perform its tasks. As user populations grow and resources are added to the environment, the demands placed on each Policy Server within the environment grow. If the demands placed on the Policy Server exceed the capabilities of the server, performance suffers.

By default, the Policy Server provides 256 sockets for port 44443 (authorization, authentication, and accounting) when installed on either Windows NT or UNIX. Each socket can remain open for an unlimited period of time.

Two general factors can help you determine when to add Policy Servers to your environment:

- Determining the number of sockets a Web Agent opens to the Policy Server
- Determining the number of Web Agents a Policy Server supports

Determine the Number of Sockets Opened to a Policy Server

The Policy Server combines the following functions into one service:

- Authentication
- Authorization
- Accounting

By default this Policy Server service listens for Web Agent requests on port 44443.

**Note:** The Policy Server Management Console lists the default ports of 44442, 44443, and 44441 for Authentication, Authorization, and Accounting, respectively, for 5.x Web Agent mixed-mode compatibility with the Policy Server. A 5.x Web Agent can open sockets across all three ports to communicate with a Policy Server service.
The number of sockets a Web Agent opens to the Policy Server port is dependent on the following:

- The socket configuration settings in the Web Agent's host configuration object
- The web server's mode of operation and configuration
  - single-process/multi-threaded
  - multi-process/single-threaded
  - multi-process/multi-threaded
  
  **Note:** Refer to your vendor-specific documentation to determine the mode of operation in which your web server is operating.
- The Web Agent version

### Host Configuration Object Socket Parameters

The number of sockets a Web Agent opens to a Policy Server is defined in the Host Configuration Object (HCO). The settings include:

**MaxSocketsPerPort**

Specifies the total number of sockets that a Web Agent can open to the port on which the Policy Server service is listening.

**Default:** 20

**MinSocketsPerPort**

Specifies, on start up, the minimum number of sockets that a Web Agent opens to the port on which the Policy Server service is listening.

**Default:** 2

**NewSocketSetup**

Specifies the increment to which new sockets are created. New sockets are created up to the number specified by MaxSocketsPerPort.

**Default:** 2
Single-Process/Multi-Threaded Web Server

A single-process/multi-threaded web server creates multiple threads to handle client requests. Each thread requires the Web Agent to open a socket to the Policy Server port on which the service is listening.

**Note:** You configure the maximum number of threads a process creates in the web server's configuration file. Consider the expected load on the web server when configuring this setting. Refer to your vendor-specific documentation for more information.

All three HCO parameters, MaxSocketsPerPort, MinSocketsPerPort, and NewSocketSetup, apply to a Web Agent installed on a single-process/multi-threaded web server.

**Example: 5.x Web Agent**

Using the default socket settings in the HCO on startup, a 5.x Web Agent opens two sockets to each port, 44441, 44442, and 44443, as specified by MinSocketsPerPort. As needed, the Web Agent opens additional sockets on each port as specified by NewSocketSetup up to the number specified by MaxSocketsPerPort.

The maximum number of sockets a 5.x Web Agent opens to communicate with each Policy Server listed in its HCO is 60:

\[(\text{MaxSocketsPerPort}) \times (\text{Number of Ports on which Service Listens}) = (\text{Max Sockets})\]

\[20 \times 3 = 60\]

**Example: 6.x Web Agent**

Using the default socket settings in the HCO on startup, a 6.x Web Agent opens two sockets to port 44443, as specified by MinSocketsPerPort. As needed, the Web Agent opens additional sockets on port 44443 as specified by NewSocketSetup up to the number specified by MaxSocketsPerPort.

The maximum number of sockets a 6.x Web Agent opens to communicate with each Policy Server listed in its HCO is 20.

\[(\text{MaxSocketsPerPort}) \times (\text{Number of Ports on which Service Listens}) = (\text{Max Sockets})\]

\[20 \times 1 = 20\]
**Multi-Process/Single-Threaded Web Server**

A multi-process/single-threaded web server creates multiple, concurrent single-threaded processes to handle client requests. Each thread requires the Web Agent to open a socket to the port on which the Policy Server service is listening.

**Note:** You configure the maximum number of processes the web server creates in the web server’s configuration file. Consider the expected load on the web server when configuring this setting. Refer to your vendor-specific documentation for more information.

The MinSocketsPerPort setting in the HCO is the only applicable socket parameter to a Web Agent installed on a multi-process/single-threaded web server because the web server handles each request with a separate process. A Web Agent never has to handle more than one thread per process. As such, the Web Agent only needs to open one socket on start-up and does not need to open further sockets.

**Note:** CA recommends changing the MaxSocketsPerPort, MinSocketsPerPort, and NewSocketSetUp default settings to 1 to prevent Web Agents from opening unnecessary sockets. More information on modifying the default HCO settings exist in the *Policy Server Configuration Guide*.

**Example: 5.x Web Agent**

In this example, the Web Server is configured for 150 concurrent processes. Your environment may differ.

Using a MinSocketsPerPort setting of 1 on startup, a 5.x Web Agent opens one socket to each Policy Server port: 44441, 44442, and 44443. The maximum number of sockets a 5.x Web Agent opens to communicate with each Policy Server listed in its HCO is 450.

\[
(\text{Max Processes}) \times (\text{MinSocketsPerPort}) \times (\text{Number of Ports on which Service Listens}) = (\text{Max Sockets})
\]

\[
150 \times 1 \times 3 = 450
\]

**Example 6.x Web Agent**

In this example, the Web Server is configured for 150 concurrent processes. Your environment may differ.

Using a MinSocketsPerPort setting of 1 on start-up, a 6.x Web Agent opens one socket to port 44443. The maximum number of sockets a 6.x Web Agent opens to communicate with each Policy Server listed in it HCO is 150:

\[
(\text{Max Processes}) \times (\text{MinSocketsPerPort}) \times (\text{Number of Ports on which Service Listens}) = (\text{Max Sockets})
\]

\[
150 \times 1 \times 1 = 150
\]
Multi-Process/Multi-Threaded Web Server

A multi-process/multi-threaded web server creates multiple, concurrent multi-threaded processes to handle client requests. Each thread requires the Web Agent to open a socket to the port on which the Policy Server service is listening.

**Note:** You configure the maximum number of processes the web server creates and the maximum number of child threads for each process in the web server's configuration file. Consider the expected load on the web server when configuring these settings. Refer to your vendor-specific documentation for more information.

All three HCO parameters, MaxSocketsPerPort, MinSocketsPerPort, and NewSocketSetup, apply to a Web Agent installed on a multi-process/multi-threaded web server.

**Example: 5.x Web Agent**

In this example, the web server is configured for 150 concurrent processes. Your environment may differ.

Using the default socket settings in the HCO on startup, a 5.x Web Agent opens two sockets to each port, 44441, 44442, and 44443, as specified by MinSocketsPerPort. As needed, the Web Agent opens additional sockets on each port as specified by NewSocketSetup up to the number specified by MaxSocketsPerPort. The maximum number of sockets a 5.x Web Agent opens to communicate with each Policy Server listed in its HCO is 9000.

\[
(\text{MaxSocketsPerPort}) \times (\text{Number of Ports on which Service Listens}) \times (\text{Max Processes}) = (\text{Max Sockets})
\]

\[
20 \times 3 \times 150 = 9000
\]

**Example: 6.x Web Agent**

In this example, the web server is configured for 150 concurrent processes. Your environment may differ.

Using the default socket settings in the HCO on startup, a 6.x Web Agent opens two sockets to port 44443, as specified by MinSocketsPerPort. As needed, the Web Agent opens additional sockets as specified by NewSocketSetup up to the number specified by MaxSocketsPerPort. The maximum number of sockets a 6.x Web Agent opens to communicate with each Policy Server listed in its HCO is 3000:

\[
(\text{MaxSocketsPerPort}) \times (\text{Number of Ports on which Service Listens}) \times (\text{Max Processes}) = (\text{Max Sockets})
\]

\[
20 \times 1 \times 150 = 3000
\]
Determine the Number of Web Agents a Policy Server Can Support

The load requirements of the Policy Server depend upon how many Web Agents are configured to use the Policy Server, and how many requests each Web Agent supports. The sockets required by the Web Agents that the Policy Server serves must not exceed the maximum number of sockets that Policy Server provides. Socket requests are fulfilled by the Policy Server on a first come, first served basis.

For example, by default, the Policy Server provides a maximum of 256 sockets. By default, a Web Agent uses a maximum of 20 sockets. Therefore, if you do not modify the default values of either the Policy Server or the Web Agent, the Policy Server can support 12 Web Agents:

\[ 12 \text{(agents)} \times 20 \text{(sockets)} = 240 \text{(sockets)} \]

This configuration is acceptable because the total sockets required (240) is less than the 256 maximum default threshold. Adding another Web Agent would increase the socket requirement to 260, which the Policy Server could not support.

If you increase the sockets per port parameter for the Web Agent, the Policy Server would support fewer Web Agents, unless you modified the number of sockets the Policy Server provided.

For example, if the Policy Server provided 256 sockets, it would also support the following configuration:

\[ 4 \text{(agents)} \times 25 \text{(sockets)} + 10 \text{(agents)} \times 15 \text{(sockets)} = 250 \text{(sockets)} \]

The total number of sockets used (250) would be less than the maximum number of sockets provided by the Policy Server. The four Web Agents configured to use 25 sockets could protect heavily used sites, where as the ten Web Agents using only 15 sockets could protect sites that experience lower traffic.

If the number of sockets required by the Web Agents exceeds the maximum provided by the Policy Server, you must do one of the following:

- Increase the number sockets provided by the Policy Server, as described in the following section, or
- Add another Policy Server to the configuration
Modify the Number of Connections Provided by Policy Servers

Modify the number of connections the Policy Server supports by changing the Max Connections value on the Settings tab of the Policy Server Management Console for each of the Policy Server.

Generally, there is no reason to decrease the default number of connections (256). You should only increase the value if the Web Agents served by the Policy Server require additional connections.

The maximum number of connections that the Policy Server can support is determined by the following settings:

- On UNIX: the kernel limit on open file descriptors. For more information about how to set this parameter, see the Policy Server installation instructions for UNIX in the Policy Server Installation Guide.
- On Windows: the number of open handles

A proper nofiles(descriptors) setting is required on Solaris Policy Servers to accommodate the sockets being opened by the Web Agents. This configures the ulimit or the number of file descriptors available to each Policy Server service. The ulimit should be set to at least 1024, and may be higher depending on the system needs and the version of Solaris being used. To set nofiles(descriptors) to 1024, for example, run ulimit -n 1024; this command usually is placed in smuser’s .profile file so that it runs whenever smuser logs in (su – smuser). The nofiles(descriptors) value determines the maximum number of sockets and files which may be used at the same time by the process, which may include, besides connections to the agent, connections to such objects as the user directory and log files.

The Maximum Connections value may be increased up to just below the ulimit.

**Note:** There is a theoretical MaxConnections maximum of 32,000. However, CA recommends setting MaxConnections no higher than 10,000, which is the maximum tested value.

Note that some room must be left when setting Maximum Connections. For example, if it is calculated that there could be up to 1024 Web Agent connections, you should use the Settings Tab to set Maximum Connections to a slightly higher value, such as 1256.
Sample Calculations for Sockets and Maximum Connections

The following sections provide examples of how to calculate the needed number of sockets for Agents and the maximum connections for Policy Servers.

**IIS and Sun Java Systems Examples**

If there is one Web Agent, and thus one trusted host, connecting to the Policy Server, and the MaxSocketsPerPort setting is 20, then there will be a maximum of 20*1 = 20 open sockets. Even if multiple Agent identities are created within that Web Agent, as long as there is only one smhost.conf file, only one set of sockets will be opened to the Policy Server. If there are any Web Agents using the Policy Server for failover, then MinSocketsPerPort for each trusted host must also be added (except for Apache – see below). You should also calculate the total number of sockets needed on the Policy Server if all of the Agents failover completely.

By default, the maximum number of Agent connections is 256. If the number of client connections exceeds the number that the Policy Server can accept, the Policy Server will refuse additional connections. If this occurs, then with debug tracing enabled on the Policy Server, the following message appears in the debug log for the affected service:

"Rejected connection request. Too many server threads (256) or server is shutting down."

In addition, 500 errors appear in the browser making the request.

**Apache Examples**

In Apache, the number of connections is calculated as one connection per Apache child process, per trusted host. For example, if you have a maximum of 150 child processes (value of MaxClients in httpd.conf) and 1 trusted host, then there will be a maximum of 150 * 1 = 150 connections from that Agent. The maximum number of child processes (Apache agents) / MinSocketsPerPort (other agents) for other Web Agents using the Policy Server for failover must also be added to that total.

If this occurs, then with debug tracing enabled on the Policy Server, the following message appears in the debug log for the affected service:

"Rejected connection request. Too many server threads (256) or server is shutting down."

In addition, 500 errors appear in the browser making the request.
IIS and Sun Java Systems Recommendations

For IIS and Sun Java Systems Web Agents, if all sockets in the connection pool are being used, then this usually indicates that there is a bottleneck in the back end (Policy Server, user directory, and so on). For that reason, and to limit the number of connections to the Policy Server, CA recommends against increasing MaxSocketsPerPort above the default of 20. With the default MaxSocketsPerPort (Web Agent) and Maximum Connections (Policy Server) settings, 10-15 Agent identities may connect to a single Policy Server. You must ensure that the maximum number of sockets that can be opened does not exceed the capacity of the Policy Server to accept those connections.

Apache Recommendations

For Apache Web Agents, the suggested ratio of Web Agents to Policy Servers is of 2-4 Agent identities per Policy Server, depending on the Maximum Connections setting on the Policy Server and the MaxClients setting on each Apache instance, and the number of agent identities. You must ensure that the maximum number of sockets that can be opened does not exceed the capacity of the Policy Server to accept those connections.

How the Policy Server Threading Model Works

The Policy Server worker thread pool consists of two separate thread pools that independently process High Priority and Normal Priority messages. A reactor thread receives all incoming Web Agent requests and depending on the message type, passes them to either the High Priority or Normal Priority queue. High Priority messages include Agent connection requests. Normal Priority messages include user messages, such as authentication and authorization requests.

- **High Priority messages**—the default number of worker threads in the thread pool available for High Priority messages is five and the maximum number is 20. You can change the default value by adding and setting the PriorityThreadCount registry key.

- **Normal Priority messages**—the default number of worker threads in the thread pool available for Normal Priority messages is eight. You can add additional worker threads by modifying the Maximum Threads setting field on the Data tab in the Policy Server Management Console.

**Note:** For more information, see the Policy Server Management Console Reference in this guide.

The maximum number of worker threads available to Normal Priority messages depends on the operating system on which the Policy Server is installed and on the amount of memory available to the system. See your vendor-specific documentation for more information about thread usage.

Varying the size of the thread pool to improve performance is an iterative process that is largely dependent on the specific environment in use.
How to Configure Policy Servers Under Heavy Loads

If the load requirements of the Policy Server serving your site are large (any number that requires a great deal of CPU usage), you can:

- Turn Off Logging—Unless you are tracking log information for a specific reason, such as troubleshooting or monitoring usage, turn off logging. Logging may have an adverse affect on performance.
- Add Memory—Add more memory to the servers hosting the Policy Server. This will enable you to set a higher number of maximum sockets for the Policy Server.
- Add Additional Policy Servers—Adding additional Web servers for more Policy Servers enables the site to support more users and resources. Each Policy Server can be configured to use the same policy store. The Web Agents in the site can then be configured to use different Policy Servers, which spreads the load requirements among the multiple Policy Servers and improves performance.

Netscape LDAP Directory Tuning

When using a Netscape LDAP directory for the policy store or user directory, follow these guidelines:

- Configure a primary and secondary directory, and configure the Policy Server to failover to the secondary directory. Configuring a backup directory ensures that if the primary directory fails, the secondary directory can be used in its place.
- Modify the LDAP directory timeout value to a number that is less than the Web Agent request timeout. For example, if the Web Agent request timeout is 60 seconds, set the LDAP timeout to 50 seconds. Setting a smaller timeout for the LDAP directory will avoid waiting for the LDAP directory to respond.
- Increase the size limit in entries. Specifies the maximum number of entries to return from a search operation.
- Increase the look thru limit entries. Specifies the maximum number of entries that are checked in response to a candidate search request.
- Increase max entries in cache. Specifies the number of entries the directory server will maintain in cache. Increasing this number uses more memory but can substantially improve search performance.
- Increase the DB cache size in bytes. Specifies the size in bytes of the in-memory cache. Increasing this number uses more memory but can substantially improve server performance, especially during modifications or when the indexes are being built. However, do not increase this number beyond the available resources for your machine.

For more information, see your LDAP documentation.
Replication Considerations

Replicating databases is a process of creating and managing duplicate versions of a directory or database. Replicating databases and directories enables you to make changes to one directory, such as importing a policy store, and mirror the changes in the replicated database or directory.

Replicate databases and directories to:

■ Improve performance in geographically distributed environments. For example, if there is a Policy Server in London, England and a Policy Server in Boston, Massachusetts, and the policy store is in Boston, you could replicate the policy store database and provide the London office with the replica. By replicating the policy store, both Policy Servers would be accessing the same data. However, the Policy Server in London could now access the replicated policy data faster, while creating less network traffic.

■ Safeguard data. Replicating databases enables you to configure failover. If one database is taken off-line to be backed up or fails to respond to a request, the replicated database can be used in its place.

UNIX Server Tuning

To improve the performance of a UNIX server, follow these guidelines:

■ Minimize the paging of memory to disk. Server performance often suffers if paged memory is used.

■ Decrease size of buffers servicing requests. HTTP traffic found at Web sites is typically smaller than default buffer sizes.

nofiles Parameter

The nofiles parameter defines the total number of sockets and file descriptors that the shell and its descendants have been allocated. By default, this parameter is set to 64 on UNIX servers. Increasing this value increases the number of sockets you can use. For more information, see the Web Agent Installation Guide.
File Descriptors

The maximum number of file descriptors available to a Policy Server must match or exceed the sum of the maximum numbers of connections configured for each Web Agent talking to this Policy Server. However, in the case of Apache Web Agents, each child process may potentially use up to the maximal number of connections as well.

Therefore, it is recommended that the maximum number of file descriptors is set to unlimited on the Policy Server side. The maximum number of file descriptors can be configured by running the ulimit -n <value> command, where <value> is a positive integer or the word "unlimited".

Timezone Considerations

Policy and rule time restrictions are based on the local time defined on the server hosting the Policy Server. For example, if the Policy Server resides in Portland, Oregon, and a rule is configured to fire between 9 am and 5 pm, the rule would actually fire in Boston, Massachusetts between noon and 8 pm.

However, to configure Agent key rollovers, you must specify the time using Greenwich Mean Time (GMT). Using GMT ensures that all the keys rollover at the same time, regardless of the geographical location.

Note: For more information, see the Web Agent Configuration Guide.
Appendix D: Log File Descriptions

This section contains the following topics:

- smaccesslog4 (see page 253)
- smobjlog4 (see page 258)

**smaccesslog4**

The following table describes the logging that appears in smaccesslog4, which logs authentication and authorization activity.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
<th>Null?</th>
<th>Field Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>sm_timestamp</td>
<td>This marks the time at which the entry was made to the database.</td>
<td>NOT NULL</td>
<td>DATE</td>
</tr>
<tr>
<td>sm_categoryid</td>
<td>The identifier for the type of logging. It may be one of the following:</td>
<td>NOT NULL</td>
<td>NUMBER(38)</td>
</tr>
<tr>
<td></td>
<td>■ 1 = Auth</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>■ 2 = Az</td>
<td></td>

Appendix E: Publishing Diagnostic Information

This section contains the following topics:

- Diagnostic Information Overview (see page 263)
- Use the Command Line Interface (see page 263)
- Published Data (see page 265)

Diagnostic Information Overview

The Policy Server includes a command line tool for publishing diagnostic information about a SiteMinder deployment. Using the tool, you can publish information about Policy Servers, policy stores, user directories, Agents, and custom modules.

Use the Command Line Interface

The Policy Server includes a command that can be executed at the command line to publish information. The command is located in the

```
installation_dir/siteminder/bin directory.
```

To publish information, use smpolicysrv command, followed by the -publish switch. For example:

```
smpolicysrv -publish <optional file_name>
```

Note: On Windows systems, do not run the smpolicysrv command from a remote desktop or Terminal Services window. The smpolicysrv command depends on inter-process communications that do not work if you run the smpolicysrv process from a remote desktop or Terminal Services window.

Important! If you are running a SiteMinder utility or executable on Windows Server 2008, be sure to open the command–line window with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.
Specify a Location for Published Information

Published information is written in XML format to a specified file. The specified file name is saved in the following registry key:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\Publish
```

This key is located in the system registry on Windows systems, and in the install_dir/registry/sm.registry file on UNIX. The default value of the registry setting is:

```
policy_server_install_dir>\log\smpublish.xml
```

If you execute `smpolicysrv -publish` from a command line, and you do not supply a path and file name, the value of the registry setting determines the location of the published XML file.

**Note:** On Windows systems, do *not* run the smpolicysrv command from a remote desktop or Terminal Services window. The smpolicysrv command depends on inter-process communications that do not work if you run the smpolicysrv process from a remote desktop or Terminal Services window.

**Important!** If you are running a SiteMinder utility or executable on Windows Server 2008, be sure to open the command–line window with Administrator permissions, even if you are logged into the system as an Administrator. For more information, see the release notes for your SiteMinder component.

**To specify a location and generate output in an XML file**

1. From a command line, navigate to:
   ```
   installation_dir\siteminder\bin
   ```

2. Type the following command:
   ```
   smpolicysrv -publish path_and_file_name
   ```
   For example, on Windows:
   ```
   smpolicysrv -publish c:\netegrity\siteminder\published-data.txt
   ```
   For example, on UNIX:
   ```
   smpolicysrv -publish /netegrity/siteminder/published-data.txt
   ```

The Policy Server generates XML output in the specified location and updates the value of the HKEY_LOCAL_MACHINE\SOFTWARE\Netegrity\SiteMinder\CurrentVersion\Publish registry key to match the location you specified.
Published Data

This section outlines the information that may be published for the following:

- Policy Servers
- Policy/Key Stores
- User Directories
- Agents
- Custom Modules

Published Policy Server Information

The Policy Server information includes the server name, platform, configuration, and server versions information. In addition, any registry settings used to configure the Policy Server may be published.

Published Policy Server information includes:

- Basic Information:
  - Name
  - Versioning
  - Platform
  - Thread Pool statistics
- Server Configuration (those values set in the Policy Server Management Console):
  - Key Management
  - Journaling
  - Caching
  - Event Handlers
  - Trace Logging
  - Audit Logging
Published Policy Server XML Output Format

The following example shows how Policy Server information is formatted:

```xml
<SERVER>
  <SHORT_NAME> smpolicysrv </SHORT_NAME>
  <FULL_NAME> SiteMinder Policy Server </FULL_NAME>
  <PRODUCT_NAME> SiteMinder(tm) </PRODUCT_NAME>

## Published Data

### TAG | Contains | Description | Parent Tag | Required
--- | --- | --- | --- | ---
KEYMGT | Empty, | Indicates Key Management settings  
(Generation: if automatic key generations is enable)  
(Update: if automatic updating of agent keys is done.) | SERVER | Required
GENERATION | Enabled or disabled | Enabled or disabled indicates the automatic key generation is enabled | KEYMGT | Required
UPDATE | Enabled or disabled | Indicates that automatic update of agent keys is enabled | KEYMGT | Required
USERAZCACHE | Elements | Information about the User AZ cache settings | SERVER | Required
MAX | Int | Maximum number of cache entries | USERAZCACHE | Required
LIFETIME | int | Life time of cached object | USERAZCACHE | Required
PORT | Int | Port Number | SERVER | Required
RADIUS_PORT | Int | Radius Port number (if enabled) | SERVER | Required
STATE | text, enabled or disabled | Indicates if something is enabled or disabled | Many tags | Various

### Published Object Store Information

The Policy Server can store information in the following types of object stores:

- policy store
- key store
- audit log store
- session server store

Published object store information includes the type of object store is being used, back-end database information, configuration, and connection information.
Published Policy/Key Store XML Output Format

The following example shows how policy/key store information is formatted:

```
<POLICY_STORE>
  <DATASTORE>
    <NAME> Policy Store </NAME>
    <USE_DEFAULT_STORE> false </USE_DEFAULT_STORE>
    <LOADED> true </LOADED>
    <SERVER_LIST>
      <CONNECTION_INFO>
        <TYPE> ODBC </TYPE>
        <SERVICE_NAME> sm </SERVICE_NAME>
        <USER_NAME> sa </USER_NAME>
        <DBMS_NAME> Microsoft SQL Server </DBMS_NAME>
        <DRIVER_NAME> Microsoft SQL Server </DRIVER_NAME>
        <DBMS_VERSION> 08.00.0760 </DBMS_VERSION>
      </CONNECTION_INFO>
    </SERVER_LIST>
  </DATASTORE>
  <DATASTORE>
    <NAME> Key Store </NAME>
    <USE_DEFAULT_STORE> true </USE_DEFAULT_STORE>
    <LOADED> true </LOADED>
  </DATASTORE>
  <DATASTORE>
    <NAME> Audit Log Store </NAME>
    <USE_DEFAULT_STORE> true </USE_DEFAULT_STORE>
    <LOADED> true </LOADED>
  </DATASTORE>
  <DATASTORE>
    <NAME> Session Server Store </NAME>
    <USE_DEFAULT_STORE> false </USE_DEFAULT_STORE>
    <LOADED> false </LOADED>
  </DATASTORE>
</POLICY_STORE>
```
The following table defines the policy/key store information that is published.

<table>
<thead>
<tr>

Published User Directory Information

For each user directory that has been loaded and accessed by the Policy Server, the following information can be published:

- Configuration
- Connection
- Versioning
Published User Directory XML Output Format

The user directory information will be formatted like the following example:

**Note:** The published information will vary depending on the type of user directory.

```xml
<USER_DIRECTORIES>
  <DIRECTORY_STORE>
    <TYPE>ODBC</TYPE>
    <NAME>sql5.5sample</NAME>
    <MAX_CONNECTIONS>15</MAX_CONNECTIONS>
    <SERVER_LIST>
      <CONNECTION_INFO>

</table>
Published Custom Modules Information

Custom modules are DLLs or libraries that can be created to extend functionality of an existing Policy Server. These come in several types: event handlers, authentication modules, authorization modules, directory modules, tunneling modules, and DMS modules. Authentication modules are generally referred to as custom Authentication schemes and the Authorization modules are known as Active Policies. Tunnel modules are used to define a secure communication with an Agent. Event modules provide a mechanism for receiving event notifications. Information about which custom modules have been loaded by a Policy Server can be published. Each type of custom module is defined in its own XML Tag.

Published Custom Modules XML Output Format

The following table defines the custom module information that will be published.

<table>
<thead>
<tr>
<th>TAG</th>
<th>Contains</th>
<th>Description</th>
<th>Parent Tag</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVENT_LIB</td>
<td>Elements</td>
<td>Indicates data about Event API custom Modules</td>
<td>SMPUBLISH</td>
<td>Optional</td>
</tr>
<tr>
<td>AUTH_LIB</td>
<td>Elements</td>
<td>Indicates data about Authentication API custom Modules</td>
<td>SMPUBLISH</td>
<td>Optional</td>
</tr>
<tr>
<td>DS_LIB</td>
<td>Elements</td>
<td>Indicates data about Directory API custom Modules</td>
<td>SMPUBLISH</td>
<td>Optional</td>
</tr>
<tr>
<td>DMS_LIB</td>
<td>Elements</td>
<td>Indicates data about DMS workflow API custom Modules</td>
<td>SMPUBLISH</td>
<td>Optional</td>
</tr>
<tr>
<td>TUNNEL_LIB</td>
<td>Elements</td>
<td>Indicates data about Tunnel API custom Modules</td>
<td>SMPUBLISH</td>
<td>Optional</td>
</tr>
<tr>
<td>AZ_LIB</td>
<td>Elements</td>
<td>Indicates data about Authorization API custom Modules</td>
<td>SMPUBLISH</td>
<td>Optional</td>
</tr>
</tbody>
</table>

The following are common to every type of custom module:

<table>
<thead>
<tr>
<th>TAG</th>
<th>Contains</th>
<th>Description</th>
<th>Parent Tag</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>FULL_NAME</td>
<td>Text</td>
<td>Full name of library or DLL include path.</td>
<td></td>
<td>Required</td>
</tr>
<tr>
<td>CUSTOM_INFO</td>
<td>Text</td>
<td>Information provided by the custom library.</td>
<td></td>
<td>Optional</td>
</tr>
<tr>
<td>LIB_NAME</td>
<td>Text</td>
<td>Library or DLL name</td>
<td></td>
<td>Optional</td>
</tr>
</tbody>
</table>
The following are specific to certain types of modules:

<table>
<thead>
<tr>
<th>TAG</th>
<th>Contains</th>
<th>Description</th>
<th>API Type</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE_FUNCTION</td>
<td>Text</td>
<td>Name of function loaded to be callable as an active expression</td>
<td>Authorization API</td>
<td>Optional</td>
</tr>
</tbody>
</table>
## Appendix F: Error Messages

This section contains the following topics:

- **Authentication** (see page 279)
- **Authorization** (see page 293)
- **Server** (see page 295)
- **Java API** (see page 311)
- **LDAP** (see page 319)
- **ODBC** (see page 344)
- **Directory Access** (see page 347)
- **Tunnel** (see page 352)

### Authentication
