Preface

Overview

Welcome to Unicenter Job Management for OpenVMS. Unicenter Job Management for OpenVMS includes the component Unicenter Job Management Manager (the manager). Throughout this guide, we use the component name in our discussion.

This guide explains how to use the manager software on the OpenVMS operating system. The manager lets you automate and manage repetitious computer processing jobs, such as fiscal reporting procedures, system maintenance tasks, and user applications.

Audience

This guide is written for the following personnel:

- Data center operations personnel, including system managers, system operators, and schedulers
- Production application support personnel
- Application developers
- Other OpenVMS users

This guide assumes that Unicenter Job Management Manager programmers are familiar with the OpenVMS operating system and with processing Digital Command Language (DCL) commands in both interactive and batch modes.

Chapter 1: An Overview of Unicenter Job Management Manager

Overview

This chapter covers the following topics:

■ About Unicenter Job Management Manager (the manager)
■ Features and uses
■ How to access the manager
■ Comparing detached processes in the manager with OpenVMS standard batch processes
■ Privileges needed to use the manager
■ Wide area network support
About Unicenter Job Management Manager

The manager is a combination of job controller, database, and logging system. It helps data center personnel, individual users, and general OpenVMS users increase their productivity by providing a hands-off approach to running repetitive jobs.

Unicenter Job Management Manager:
- Automates and manages jobs that run repeatedly, such as fiscal reports, operating system maintenance tasks, and user applications.
- Separates all scheduling specifics such as the schedule interval, completion notification, and job dependencies from the job’s main task.
- Has a logging system that captures events, so you can generate accounting and historical reports.
- Is a fully distributed product. All functions and features work remotely as well as locally, transparent to the user except where noted.
- Provides for automatic node failover and easily customized load balancing for OpenVMS Cluster systems.

Features and Uses

The manager has a number of useful features for creating and managing repetitive jobs.

Jobs
- You can create jobs that consist of a single system-level command or a command file containing many commands.
- Your repetitive jobs run automatically, based on scheduled intervals and other criteria you specify. For example, you can specify mail notification for completed jobs, or what to do if a system failure occurs.
- You can modify selected job criteria without having to resubmit a job. The manager maintains your job criteria in its job database, separate from job actions.
- You can modify job characteristics for a single run or for all future runs.
- You can specify commands to run before or after a job (prefunctions and postfunctions).
How to Access Unicenter Job Management Manager

Networks and Synchronized Jobs
- You can schedule jobs within a cluster of nodes or among remote nodes on a network.
- You can synchronize a job with up to 16 other jobs, in the same OpenVMS Cluster or on remote nodes. Those 16 jobs can be synchronized with other jobs, giving the effect of unlimited job dependencies.

Mail Notification and Reports
- You can send job completion notifications by OpenVMS mail, terminal broadcast messages, and OPCOM messages.
- The manager provides a standard format for log reports. You can customize the format to fit your specific requirements.
- You can view a job history for any number of jobs.

System Management
- You can restart interrupted jobs on failover nodes, based on the job criteria, restart labels, and strings within the command procedure.
- Management commands allow the system manager to control the Unicenter Job Management Manager processing environment, including load balancing, failover, event logging, and network events.

How to Access Unicenter Job Management Manager

There are two ways to access the manager:

- **DCL interface** (Chapter 4)
  DCL commands provide easy access on all OpenVMS hardware platforms to job database information and current job status. You can run, modify, or review jobs by job name, number, group, owner, or type. The manager supports the use of wildcards on each of a job’s fields, so you can enter a single command for multiple jobs.

  You can use the DCL interface to access the full set of Unicenter Job Management Manager commands (general user commands and also management commands) if you have the required system privileges.

- **Motif interface** (Chapter 5)
  If you have a workstation or other DECwindows display device you can use the Motif interface, which provides you with a graphic view of Unicenter Job Management Manager jobs. Jobs are represented by boxes. Job dependencies are indicated by arrows that show you the order in which jobs are performed.

  You can access all general user commands using menus and dialog boxes; you cannot access management commands using the Motif interface.
Comparing Unicenter Job Management Manager Detached Processes with OpenVMS Standard Batch Processes

The manager offers both detached and batch processing. For many repetitive tasks, Unicenter Job Management Manager detached processing can be easier to use than OpenVMS standard batch processing. The table below shows how detached processing and OpenVMS batch (without Unicenter Job Management Manager) handle several common tasks.

<table>
<thead>
<tr>
<th>Function</th>
<th>Unicenter Job Management Manager Detached Process</th>
<th>OpenVMS Batch Process (without Unicenter Job Management Manager)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processing a single DCL command</td>
<td>Allows single DCL commands or command files.</td>
<td>Requires a command file.</td>
</tr>
<tr>
<td>Modifying a job record</td>
<td>Modifies and runs jobs repeatedly.</td>
<td>Jobs must be resubmitted.</td>
</tr>
<tr>
<td>Modifying job criteria</td>
<td>Separates criteria from the job itself; you can modify criteria without modifying the job.</td>
<td>The job and its criteria must be deleted, modified, and resubmitted.</td>
</tr>
<tr>
<td>Identifying file versions</td>
<td>Uses a file name. Runs the most current file version or the version you specify.</td>
<td>Uses an OpenVMS record management services (RMS) file identification. Runs the version that existed when the job was submitted, regardless of any new changes made to the file.</td>
</tr>
</tbody>
</table>

Here is a list of some tasks you can perform using the manager that you cannot perform using standard OpenVMS batch mode:

- Override job settings for a single run
- Synchronize multiple jobs on an OpenVMS Cluster
- Specify failover actions for interrupted jobs
- Access jobs by Motif interfaces
- Specify prefunctions and postfunctions to perform before or after a job
- Issue warning messages when a job exceeds the maximum run time or does not start when expected
For functions that involve timing between different nodes, such as maximum run time and start time for remote or batch mode jobs, system times must be synchronized.

**Note:** OpenVMS detached processes created by the manager carry the processing mode of OTHER for detached processes, or BATCH for batch processes. Before you run existing command procedures under the manager, change the test for F$MODE() .EQS. "BATCH", to:

```
IF F$MODE() .EQS. "BATCH" OR F$MODE() .EQS. "OTHER"
```

Batch mode further increases the versatility and usefulness of the manager. For a description of the manager, see Using Batch Mode in the chapter "How Unicenter Job Management Manager Works."

**Privileges Needed to Use Unicenter Job Management Manager**

The manager provides commands to create and control jobs, and management commands to control the operation of the manager system itself. In general, you need either SYSPRV or OPER OpenVMS privileges to issue the manager management commands (some management commands require other privileges as well). General users can perform operations on their own jobs, and on other jobs based on OpenVMS privileges and identifiers.

There are three types of access that users can have to jobs:

- **READ access** permits you to see information about a job and to synchronize other jobs to that job.
- **EXECUTE access** allows you to control how a job runs, but not what it does.
- **WRITE access** allows full control of job characteristics.

Your OpenVMS privileges and your UIC, the OpenVMS identifiers and UIC associated with the job, and identifiers that you hold, determine the access that you have to a job.

You have **READ access** to a job if at least one of the following is true:

- Your user identification code (UIC) matches the job’s UIC.
- Your group UIC matches the job’s group UIC.
- SYSPRV privilege is enabled.
- BYPASS privilege is enabled.
- READALL privilege is enabled.
- You hold the READ, WRITE, or EXECUTE identifier for that job.
You have **WRITE** access to a job if at least one of the following is true:

- Your UIC matches the job’s UIC.
- Your group UIC matches the job’s group UIC and you have GROUP privilege enabled.
- SYSPRV privilege is enabled.
- BYPASS privilege is enabled.
- You hold the WRITE identifier for that job.

You have **EXECUTE** access to a job if at least one of the following is true:

- You have WRITE access to the job.
- You hold the EXECUTE identifier for the job.

To use the general commands of the manager on remote nodes of the network, you must have an authorized account on the remote node.

For a description of identifier-based access to jobs, see Identifier-Based Access to Jobs in the chapter “Getting Started with Unicenter Job Management Manager.”

---

**Privileges for Management Commands**

To use management commands of the manager, you must have one of the following OpenVMS system privileges:

- OPER
- SYSPRV

If you are unsure what your system privileges are, see your system manager.

Some management commands require other privileges. These privileges are described in the respective command descriptions.

For a description of general and management commands, see the chapter “Using the DCL Command Interface.”
Wide Area Network Support

You can use Unicenter Job Management Manager to control and coordinate the processing of jobs among nodes in a wide area network. Note the following requirements:

- The manager must be installed on both the sending and receiving nodes of the network.
- When you install the manager on each node, you must answer yes to the wide area network support question in the installation procedure.

The manager can be installed with support for executing jobs on remote OpenVMS nodes. If you want to use the manager to control jobs on one or more of these remote nodes, answer YES to this question. This feature of the manager requires that a supported TCP/IP stack be installed and running. For details on supported TCP/IP products and version, see the Unicenter Job Management for OpenVMS I64 r3 Installation Guide.

The TCP/IP network startup procedure must execute before the manager startup procedure in the system startup procedure.

In a wide area network, users can:

- Enter commands for the manager on remote nodes, if they have either a proxy account or valid account and password to access the remote nodes.
- Add remote job dependencies if they have READ access to the remote jobs.

In a wide area network, system managers can:

- Set the interval and expiration time for attempting to resend job-dependency notifications between remote nodes when communication failures occur.
- Control the information that the manager enters in the event log on remote nodes.

For functions that involve timing between different nodes, such as maximum run time and start time for remote or batch mode jobs, system times must be synchronized.
The manager keeps a record of network information in two files:

- **NSCHED$:RETRY.LOG**
  
  This file contains a history of all network operations that the manager has retried. You can type or print this file. The system manager can delete the file when it becomes too large.

- **NSCHED$:RETRY.DAT**
  
  This file is present only when retry activity is pending.
  
  The manager uses this file to control operations for resending mail notifications over the network. Deleting this file stops all retry attempts currently in progress. You cannot type or print the file. Instead, use the SCHEDULE SHOW NETWORK command to display its contents.

Remote job termination message contents are the same as regular termination messages except:

- Peak page is not used.
- BIO is total IOS.
- DIO is not used.
- Volumes are not used.

When you show a job locally it will always know the correct exit status (success or failure) of remote mode jobs. When showing that same job from across the net, the mode will be unknown and the exit status will test for SUCCESS/FAILURE/UNKNOWN based on the status number (odd or even).

Changing the mode of a currently running job may cause the results of the current run to be improperly reported. The termination information is discarded if the job starts with one mode and exits with another. This may also cause some internal counters to not be properly updated, such as the number of currently running jobs. Always verify that a job is not currently running before changing its mode. Available modes are DETACHED, BATCH, and REMOTE.

Prefunctions and postfunctions are not supported for remote mode jobs, which run on remote agents. For remote OpenVMS jobs, prefunctions and postfunctions work as usual.

The following fields are not accessible remotely; to control them the user must log directly into the remote account:

- **SJOB**
- **EXID**
- **QUEUE-NAME**
- **TJOB**
- **WRID**
- **CPU-LIMIT**
- **RDID**
- **MODE**
- **REMOTE-USER/NODE**
Chapter 2: How Unicenter Job Management Manager Works

Overview

This chapter provides general information on how Unicenter Job Management Manager (the manager) works. The following chapters provide specific information on how to access and use the manager. This chapter covers the following topics:

- Starting and stopping the manager
- Automating and managing jobs
- Job states
- Job database listing
- Accessing jobs on remote nodes
- Prefunctions and postfunctions
- Job dependencies
- Delta time formats
- Special days
- Using batch mode
- Unicenter Job Management Manager in an OpenVMS Cluster
Starting and Stopping Unicenter Job Management Manager

You can start or stop the manager using the CA Common Services startup procedure or using Unicenter Job Management Manager-specific startup procedures.

**CA Common Services Startup and Shutdown Procedures**

To start the selected components as part of CA Common Services, at the DCL prompt, enter the following:

```
$ @sys$startup:capoly$startup.com
```

To stop the selected components as part of CA Common Services, at the DCL prompt, enter the following:

```
$ @sys$startup:capoly$shutdown.com
```

**Unicenter Job Management Manager Specific Startup and Shutdown Procedures**

To start the manager, at the DCL prompt, enter the following:

```
$ @sys$startup:ujm$manager$startup.com
```

To stop the manager, at the DCL prompt, enter the following:

```
$ @sys$startup:ujm$manager$shutdown.com
```
Automating and Managing Jobs

The primary goal of Unicenter Job Management Manager is to automate and manage repetitive jobs. This section provides an overview of how the manager achieves this goal.

Job, Job Database, and Job Record

To understand how the manager manages jobs, you should understand how it defines a job, a job database, and a job record.

Job

The main part of a Unicenter Job Management Manager job can be a single system-level command or a command file containing multiple commands. A job also includes all the related information required to process commands, such as when and where to run the commands and how to complete them. You refer to a job by its job name or job number.

Job Database

A job database is the collection of information that tells the manager when and how to process each particular job. The Unicenter Job Management Manager database is a multikeyed index file that uses OpenVMS record management services (RMS) to store information about each job.

The manager is most useful when processing repetitive jobs, such as fiscal reporting procedures, system maintenance or backup tasks, and user applications. The job database is used to process repetitive jobs.

You can also use the manager to run non-repetitive jobs that would benefit from its scheduling, job synchronization, or other features.

Job Record

A Unicenter Job Management Manager job is represented in the database by a job record. You create most of the job database information when you create, copy, or modify job characteristics, such as:

- Job name, group, type
- Primary command, prefunction, and postfunction
- Schedule interval and run times
- Job dependencies
- Message notification conditions
- Job restart conditions
The primary part of a job record is a Unicenter Job Management Manager command, which is any valid system-level command you want to perform. To enter a command, you use the standard command format for the operating system that the command will execute on. In the DCL interface, you must use quotes to enclose a case-sensitive command.

Any user can create a job record or copy a record to the Unicenter Job Management Manager job database.

**Note:** The default location for files referenced in a Unicenter Job Management Manager command is your SYS$LOGIN device and directory. You can specify a different device and directory as part of your file specification.

### How Unicenter Job Management Manager Processes Jobs

By default, the manager runs a job as a detached process on OpenVMS. The manager is activated by one of two actions:

- An internal timer starts the job at its scheduled starting time, except as restricted by dependencies, Special Days, or resource availability.
- The manager receives a message to look at a particular job. The message may be the result of a Unicenter Job Management Manager command (such as Create, Modify, or Run), or a completed job.

By default, the manager **does not** use OpenVMS batch processing to run jobs. The manager creates the job process directly.

The process created by the manager first executes the system-wide and user-specific login command files. Then it executes the command file SCHEDULER$SHELL.COM supplied with the manager, in the NSCHED$: logical directory.

SCHEDULER$SHELL.COM runs a program that extracts the job’s commands from the Unicenter Job Management Manager database and performs them. When the process created by the manager exits, OpenVMS sends a completion message to the manager. The manager then updates its job database accordingly.
How Unicenter Job Management Manager Reports a Completed Job

After performing the last command in a job, the manager reports the job as complete. If the job is a command procedure, the job’s completion status is the status of the last command performed within the procedure.

If the last command in a job is successful, the manager will report a successful completion status. For example, the manager would always report a successful completion status for the following procedure, even if the COPY command failed. The reason is that the last command performed is WRITE SYS$OUTPUT.

```verbatim
$ ON ERROR GOTO ERR_EXIT:
$ COPY A.B C.D
$ EXIT
$ ERR_EXIT:
$ WRITE SYS$OUTPUT "file copy failed!"
$ EXIT
```

Because the completion status can affect the execution of other jobs depending on this job, you may have to modify your command procedure to exit with the desired status.

To modify the preceding example to complete with the desired status, change the error-handling section as follows:

```verbatim
$ ERR_EXIT:
$ SAVED_STATUS = $STATUS
$ WRITE SYS$OUTPUT "file copy failed!"
$ EXIT SAVED_STATUS
```

By default, the manager treats failures of any level as job failures. For example, the error %NSCHED-F-JOBSNOTFND is considered a FATAL error by OpenVMS instead of a less severe error. You can control this level by modifying the job status before it finishes; the postfunction is recommended as the place to do this sort of modification. For example, a DCL procedure can be written to check and change the NSCHED_STATUS symbol to achieve the desired job completion effect. Bits 0–2 of the NSCHED_STATUS can be checked for the severity level of the failure:

- 0 = Warning
- 1 = Success
- 2 = Error
- 3 = Informational
- 4 = Severe Error
- 5-7 = Reserved by Computer Associates
The OpenVMS command STOP/ID, when issued for a Unicenter Job Management Manager job process, causes the process to exit with the status of the last image that was executing. This turns out to be SUCCESS more often than not, instead of an expected FAILURE or ERROR. Be aware that the regular UJM$MANAGER$SHUTDOWN.COM procedure uses STOP/ID to stop the running processes before shutting the system down. The failover function in the manager is not activated under these circumstances because it responds to a node crash except when a node is brought down by the SHUTDOWN procedure and the jobs are given a SUCCESS completion status. Use the SCHEDULE ABORT command to stop a running job and have it exit with an UNKNOWN (interpreted as FAILURE) status.

The command pair SET LOGGING /CLUSTER_NODE=nodename and SHOW LOGGING /CLUSTER_NODE=nodename behaves differently at the DCL level and at the shell because of timing. When you wait 5 seconds between the SET and SHOW commands, both interfaces behave the same and display correct information. SHOW displays the results of the previous SET command.

This timing issue occurs because the SET LOGGING/CLUSTER command sends a request to NSCHED to make a change. If you issue the SHOW LOGGING command immediately, the shell reacts before the change is made.
Job States

Unicenter Job Management Manager jobs are always in one of six **system-assigned states**:

- Scheduled
- On hold
- Job slot wait
- Dependency wait
- Running
- Queued

You can request the manager to change the state of a job by using one of the following commands:

- Abort
- Delete
- Hold
- Release
- Run

These commands set a requested state in the Unicenter Job Management Manager database. The manager grants a request when it processes the related job’s database record.

**Restarting Jobs**

When you create a job in the database, you can specify whether or not to restart the job after system interruptions. You can also include restart labels in the job’s command procedures, if you want the job to restart from a specific step rather than at the beginning.
Unicenter Job Management Manager updates job information each time it runs a job. That information includes:

- Unique job number (assigned when the job is created)
- Current job state
- Last run time and exit status
- Next scheduled run time
- Success and failure counts
- Last run-time error message (if any)
- A list of satisfied and unsatisfied dependencies

To see a complete job database listing for one or more jobs using the DCL interface, you use the SCHEDULE SHOW JOBS/FULL command. The following example displays a job database listing:

```
Job Name             Entry    User_name    State      Next Run Time
--------             -----    ---------    -----      -------------
SAMPLE_JOB           206      EXAMPLE      Scheduled  17-APR-2003 03:00
VMS_Command : @DISK$USER1:[EXAMPLE]SAMPLE_JOB.COM
Group : (none)                             Type : (none)
Comment : This job runs nightly as a basic test
Last Start Time   : 17-Apr-2003 03:00
Last Finish Time  : 17-Apr-2003 03:10      Last Exit Status : SUCCESS
Schedule Interval : D 03:00                Mode : Detached
Mail to           : EXAMPLE (No Mail)
Days              : (MON,TUE,WED,THU,FRI)
Output File       : DISK$USER1:[EXAMPLE]SAMPLE_JOB.LOG
Cluster_CPU       : Default                Notify user upon completion
Load Balance Group: GROUP1
Run Priority      : Default
Max_Time Warning  : None                   Job Always retained
Stall Notify      : None                   No Retry on Error
Success Count     : 166                    Failure Count : 13
Owner UIC         : [201,203]              Restart on Crash
No Pre or Post Function for this job
No local jobs depend upon this job.
```

This job has no Dependencies on other jobs in the Motif interface, select which jobs to display by clicking on the Load Jobs... button in either the Graphical or Linear Display window.
Specifying a Job

You can specify a Unicenter Job Management Manager job by name or number. The job name or number is called the job specifier.

Format

```
([node::]job-name[=username])
```

For example:

```
XYZ::WEEKLY-RENAME=DOE
```

Default Node and Username

You do not have to specify a node or username for jobs that you own.

- The default node is the default executor on your local OpenVMS Cluster.
- The default username is the username for the account you are logged into.

Specifying Another User’s Job

To specify a job that belongs to another user, use the `=username` qualifier to add the user’s name to the job name. In the following example, the job COPY_IT belongs to user SMITH:

```
COPY_IT=SMITH
```

Specifying a Job Outside Your OpenVMS Cluster

You can specify Unicenter Job Management Manager jobs on nodes outside your OpenVMS Cluster if the manager is installed with its wide area network features. For example, to specify the job COPY_IT on node XYZ outside your OpenVMS Cluster, add that node name to the job name.

```
XYZ::COPY_IT
```

Uniqueness of a Job Name and Number

- Job names are unique within a specific user’s set of jobs. For example, if user Doe and user Smith each own jobs named COPY_IT, the manager treats them as two separate jobs.
- Job numbers are unique within an OpenVMS Cluster.

**Note:** The manager assigns each job in the database a unique job number. For this reason, Computer Associates does not support the use of numerical job names.

**WARNING!** Never use the statement "READ SYS$COMMAND <symbol>" in any step of a Unicenter Job Management Manager job (pre, main, or post). During the execution of Unicenter Job Management Manager jobs, SYS$COMMAND points to the SCHEDULER$SHELL command procedure. The effect of the READ statement is to read a command from the SCHEDULER$SHELL.COM file and assign it to the symbol. When the user command finishes, the next line in the SCHEDULER$SHELL should be "EXIT $STATUS." However, if this line has been read and assigned to the user symbol, the file pointer now points to the next line in SCHEDULER$SHELL.COM and the EXIT command is skipped, causing the job run process to start again.
Job Output Files

Job output files are written to the job owner’s default device and directory as specified in the authorization file for the account.

You cannot use logicals defined in the LNM$PROCESS_TABLE to direct the location of the Unicenter Job Management Manager job’s output file. The logicals that you use must be visible before you execute the user login procedure.

Using Wildcards

You can use wildcard characters when specifying jobs in Unicenter Job Management Manager commands. Follow the standard OpenVMS wildcard conventions. For example:

- The asterisk (*) wildcard is a substitute for any character or string of characters in a job specification.
- The percent (%) wildcard is a substitute for one character only.

The following examples show how to use wildcards in a full Unicenter Job Management Manager job specification.

Examples

- This example shows a full job specification without wildcards:
  
  \[ XYZ::WEEKLY-RENAME=DOE \]

- This example shows a full job specification for all jobs on node XYZ that have job names beginning with WEEKLY and are owned by users whose OpenVMS usernames begin with the letter D:

  \[ XYZ::WEEKLY*=D* \]

- This example displays a list of the current user’s jobs that begin with the letter W, on the local OpenVMS Cluster:

  \[ W* \]

Note: You cannot use wildcards in job specifiers when creating or modifying a job dependency list with the /SYNCHRONIZATION qualifier in the DCL interface.
Accessing Jobs on Remote Nodes

To perform an operation on a remote node, you must have authorized access to an account on that node. You also must have the appropriate privileges to perform the specified command.

There are three ways to access jobs on remote nodes:

■ Specify your default proxy account on the remote node. You must have a default proxy account on that node. For example:

  XYZ::WEEKLY-RENAME

■ Specify the remote node and a username for a particular proxy account in quotation marks. You must have a proxy account on that node. For example:

  XYZ"SMITH":::WEEKLY-RENAME=DOE

■ Specify the remote node and an access control string within quotation marks. For example:

  XYZ"DOE MYPASSWORD":::WEEKLY-RENAME

Prefunctions and Postfunctions

A **prefunction** is a separate command performed **before** the job’s primary command begins running. For example, a prefunction might include checking for a necessary file or ensuring that a tape is mounted before a backup procedure begins.

A **postfunction** is a separate command performed **after** the job’s primary command has completed. On the OpenVMS operating system, for example, a postfunction might include printing a directory of files created by a COPY command, or purging duplicate versions of files created by the job’s primary DCL command.

Prefunctions and postfunctions can be used by multiple jobs to reduce programming effort and increase standardization.

In the DCL interface, you can add prefunctions and postfunctions by using the `/PRE_FUNCTION` and `/POST_FUNCTION` qualifiers with the SCHEDULE CREATE, SCHEDULE COPY, or SCHEDULE MODIFY commands. For example:

$ SCHED MODIFY/PRE_FUNCTION="DIR/PRINT[DOE.PROJ-C]*.LJT;*"
$ SCHED MODIFY/POST_FUNCTION="@CHECK_DISC.COM "

In the DECwindows interfaces, you can enter prefunctions and postfunctions directly in the fields provided when creating, copying, or modifying a job.

**Prefunction and Postfunction Processing Rules**

- If the prefunction ends with an error, Unicenter Job Management Manager does not process the primary command, and ends the entire job with an error.
- If the prefunction completes successfully, the manager processes the job’s primary command.
- The manager processes the postfunction, regardless of whether the job’s primary command completes successfully or terminates with an error.
- If the postfunction completes successfully, the manager notifies you that the job completed successfully. If the job’s primary DCL command ended with an error, the manager reports those errors in the job’s specified output file (if any).
- If the postfunction ends with an error, the manager notifies you that the entire job ended with an error, even if the job’s primary DCL command completed successfully.

**Job Dependencies**

You can create a Unicenter Job Management Manager job to run in any of the following three ways:

- Standalone (does not depend on other jobs or involve a prefunction or postfunction)
- Within the constraints of a prefunction and postfunction
- Synchronized to depend on other jobs

The manager allows a job to have an unlimited number of job dependencies. For example, a primary job can depend on up to 16 other Unicenter Job Management Manager jobs; each of these jobs can depend on 16 more jobs, and so on. These jobs can be on the same node, within an OpenVMS Cluster, or on remote nodes of a wide area network.
The following diagram illustrates a job dependency hierarchy among several remote nodes of a network:

In the example:
- Job B and Job C **depend** on Job A. When Job A runs successfully, Job B and Job C can run.
- Job D **depends** on Job B. When Job B runs successfully, Job D can run.
- Job F **depends** on Job C. When Job C runs successfully, Job F can run.
- Job E depends on Jobs B and C. **Both** Job B and Job C must run successfully before Job E can run.

**Remote Nodes**

The wide area network feature allows you to:
- Use Unicenter Job Management Manager commands on remote nodes, if you have either a **proxy account** or a valid account and a password to access those nodes.
- Add job dependencies on remote jobs, if you have READ access to those jobs. If you are setting up remote synchronizations to jobs that run on a cluster that has no cluster alias, you need to specify the dependency to one specific node in that cluster and then node restrict the job running on that cluster. Without the node restriction, the job may be load balanced to any node in the cluster and the dependency may not be satisfied.

When you set up remote synchronizations to jobs that run in a cluster that does have an alias, always set the remote synchronization in terms of the cluster alias. This set up lets the dependency be satisfied regardless of what node the job runs on. If the job on the cluster is node restricted, set the dependency to that node.
The following commands and qualifiers are not supported over the network:

<table>
<thead>
<tr>
<th>Commands</th>
<th>Qualifiers</th>
</tr>

</tbody>
</table>
Delta Time Formats

Unicenter Job Management Manager uses two different delta time formats: OpenVMS delta time and Unicenter Job Management Manager delta time.

OpenVMS Delta Time

Some Unicenter Job Management Manager commands use qualifiers that require you to specify time intervals using OpenVMS delta time. Here is the format for OpenVMS delta time:

\[ dddd-hh:mm:ss.cc \]

- \( dddd \) – Days
- \( hh \) – Hours
- \( mm \) – Minutes
- \( ss \) – Seconds
- \( cc \) – Hundredths of a second

Note that at the DCL prompt, the /MAX_TIME and /STALL_TIME qualifiers require use of OpenVMS delta time; in all other interfaces, including the shell, these qualifiers use Unicenter Job Management Manager delta time.

Rules for Formatting OpenVMS Delta Time

- You can omit fields within the time only if you include the punctuation that separates the fields. For example, 2::10 means 2 hours and 10 seconds.
- You can truncate a delta time on both the right and the left. In the example 2::10, the days and hundredths-of-a-second fields are truncated.

Unicenter Job Management Manager Delta Time

The /INTERVAL qualifier, used with the COPY, CREATE, and MODIFY commands, allows you to use Unicenter Job Management Manager delta time. Here is the format for Unicenter Job Management Manager delta time:

\[ +dddd-hh:mm:ss.cc \]

- \(+dddd\) – Days
- \( hh \) – Hours
- \( mm \) – Minutes
- \( ss \) – Seconds
- \( cc \) – Hundredths of a second

Note: Note that Unicenter Job Management Manager delta time (+dddd hh:mm:ss.cc) is NOT the same as OpenVMS delta time (dddd-hh:mm:ss.cc).
Rules for Formatting
Unicenter Job Management Manager Delta Time

- You can omit fields within the time only if you include the punctuation that separates the fields. For example, “+0 2::10” means 2 hours and 10 seconds.
- You can truncate a delta time on the right. In the example “+0 2::10,” the hundredths-of-a-second fields are truncated.
- You must specify a value for days (+dddd), even if it is 0.
- In the DCL interface, you must enclose the Unicenter Job Management Manager delta time in quotes because it always contains a space after the day value.

“Time Creep” in Jobs

When a job’s schedule interval is a delta time expression, for instance, “+00 15:00,” the manager calculates the job’s next scheduled run time by adding the time interval to the job’s actual start time. Typically, there is a small time lapse (usually a second or two) between a job’s scheduled start time and the time it actually begins to run. When delta time schedule intervals are used, this time delay is reflected in the job’s next scheduled run time. For example, a job that was scheduled to start at 11:30:00.00 may be next scheduled to run at 11:45.01.35, reflecting a “time creep” of 1.35 seconds.

You can use the /USE_NEXT_TIME qualifier when creating or modifying a job that uses a delta time interval. This will calculate the next scheduled run time from the scheduled time, not from the actual start time, preventing time creep. However, if a user uses the RUN command to run the job manually, the job will add the delta time interval to the next scheduled run time. This problem can be avoided by using the command RUN/NORESCHEDULE when running the job manually.

Alternatively, you can create several similar jobs with specific schedule intervals. For example, to run a job every fifteen minutes exactly (beginning on the hour, 15 minutes past, 30 minutes past, and 45 minutes past), create four similar jobs with the following schedule intervals:

- H 00:00
- H 15:00
- H 30:00
- H 45:00

When calculating a job’s Next Scheduled Run Time, the manager starts by finding the start of the next period specified in the Schedule interval. For example, if using a schedule interval of "D 22:00," the manager first finds the start of the next Day and then applies the hour specification. The resulting Next Scheduled Run Time always lies within the next period of time. For example, if a job with an interval of “D 22:00” is created (or run) at 10AM today, the next scheduled run time for that job will be tomorrow at 22:00 (Not today at 22:00). This behavior is expected.
Note: You must keep the system times for all nodes in a cluster synchronized. Time differences between cluster nodes can result in job dependencies not being processed correctly or jobs running repeatedly.

Special Days

Special Days are those days requiring particular consideration when scheduling jobs. You may want to prevent a job from running on Special Days or restrict a job to run only on Special Days. Examples of Special Days are New Year’s Day, Thanksgiving, and Christmas, as well as company holidays, plant shutdown days, and vacation days.

Unicenter Job Management Manager Special Day support lets you:

- Define Special Days
- Control how jobs are scheduled on Special Days
- Define as many Special Days as you like
- Use Special Days to affect the scheduling of any job

You need OPER or SYSPRV privilege to create, modify, or delete a Special Day Class.

Special Day Classes are collections of days, grouped together for specific reasons. Special Day Classes may contain:

- One day only (such as New Year’s Day)
- More than one day (for instance, plant closing days)

In the DCL interface, elements of a Special Day Class are defined in terms of absolute date specifications, such as 24-MAR-2006. In the DECwindows interfaces, you define Special Days by clicking on days in a calendar.

Once defined, one or more Special Day Classes may be used in combination as a scheduling constraint for a job, doing either of the following:

- Restricting the job from running on the Special Days specified
- Requiring the job to run only on the Special Days specified

How Special Days Affect Run Times

Any time a job runs either automatically or as the result of a RUN command, the next scheduled start time for the job is calculated. This calculation takes into consideration the job’s scheduling interval, day restrictions, and Special Day Restrictions.
If a Special Day conflict is detected, requiring that the job be rescheduled or put on hold, any messages to be issued to the job’s owner and the operator will be sent at this time. Since this calculation is performed at the time a job is run, messages pertaining to a job’s Special Day scheduling conflicts may be sent before the run of the job has completed. This is normal and expected behavior.

Dynamic Changes to Special Day Classes

Because Special Day Restrictions are taken into account only when calculating a job’s next scheduled start time, and a job’s next scheduled start time is only calculated when a job is run, any changes made to a job’s Special Day Restrictions will not take effect until the next time a job is run and its next scheduled start time is calculated. Thus, creating Special Day Restrictions for a job, adding or deleting Special Day Classes from a job’s Special Day Restrictions, or modifying the contents of a Special Day Class will not change a job’s current scheduled run time. These changes will take effect the next time the job is run and its next start time is calculated.

Remote Sites

Special Day Restrictions work the same way for all jobs, whether they run locally, remotely, or have dependencies.

Note: The /SD_ACTION qualifier is not supported when a server is specified.

For a job running on a remote site, the Special Days relevant to that remote site may be defined on the scheduling node and used as a Special Day Restriction for the remote job. For example, if a job runs on a machine in Japan, but its schedule is determined by the manager running on a machine in the United States, the Special Days relevant to Japan must be defined on the machine in the United States. They may then be used as Special Day Restrictions in determining the remote job’s next scheduled run time.

For jobs in a dependency tree, Special Day Restrictions are taken into account only when determining the job’s next scheduled run time. The job will run once its next scheduled run time has passed, and its dependencies are satisfied.

Note: Special Day Restrictions on a job can also affect the run time of another job that has a dependency on that job.

Special Days are not taken into account under the following conditions:

- When the first start time for a job is calculated as it is created
- When you use the SCHEDULE SHOW SCHEDULE command
Creating the First Special Day Class

When you create the first Special Day Class in the database, the manager creates the file NSCHED$:SCHED$SD_CLASSES.DAT with the file protection S:WRED,O:WRED,G:RE,W:RE. If you later copy or back up this file with a different file protection, problems may occur when you use the Special Day Classes.

/SD_ACTION Qualifier

The /SD_ACTION qualifier is valid only for jobs that have the /NOT_ON qualifier specified for them. When a job has the /ONLY_ON qualifier specified, Special Day actions (HOLD and SKIP) have no effect.
Using Batch Mode

Unicenter Job Management Manager can use *batch* as an execution engine instead of using *detached* jobs. A job must be specially created or modified to use batch mode. The default mode is DETACHED.

Unicenter Job Management Manager Batch Characteristics

Unicenter Job Management Manager batch jobs have the following unique characteristics:

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUEUE</td>
<td>The name of a submit queue. The queue must exist on the system, and defaults to SYS$BATCH.</td>
</tr>
<tr>
<td>QPRIORITY</td>
<td>Priority to submit the job into the queue. The default is 100, minimum value is 1, and maximum value is 255.</td>
</tr>
<tr>
<td>CPULIMIT</td>
<td>The number of 100ms ticks of CPU that can be used before the job is terminated by the system. The default is 0 = infinite. The minimum is 50.</td>
</tr>
<tr>
<td>ENTRY NUMBER</td>
<td>The entry number of the job in the queue. Only present when the job is in queue.</td>
</tr>
</tbody>
</table>

Unicenter Job Management Manager Batch Execution

The manager queues the job at the specified next run time for the job. The job starts executing when the queues on the system allow it to execute.

If the queues are stopped, full, stalled, or in some other nonrun state, the job remains marked as *Queued* until the queue allows the job to execute. In this respect, the jobs are controlled by the system batch queues.

If the queue is generic, the job may run on a different node than that specified.

When a job’s mode is set, all the mode-specific characteristics are reset to the default values, or to specified values at the time of setting the mode. These values can be modified later.
Any characteristics of the queue will impact Unicenter Job Management Manager jobs, including the queue’s run priority.

**Note:** QUEUE, QPRIORITY, and CPULIMIT are supported only for batch mode. Only detached mode supports NODE_RESTRICTION and RUN_PRIORITY. Only remote mode supports REMOTE_NODE in the form of either user@node or node.

If a job’s execution queue is on a machine that does not have the manager installed, the job does not execute properly, and is marked as a failed run attempt.

**Note:** Resource accounting information for Unicenter Job Management Manager batch jobs in the event log has slightly smaller values than the corresponding process-id information in the OpenVMS accounting file. Also, peak pagefile use and total mounted volumes are not available.

If a job is deleted while pending, the manager will not actually delete the job before execution.

During the time a job is in a queued state, if a request for another run of the same job comes in, the existing request is deleted from the queue and the new one replaces it. Such requests will thus be processed until the job reaches the head of the queue and starts its run.

During the time a job is in a queued state, if a request for characteristic modifications comes in, the existing request is deleted from the queue and the new one replaces it. Such requests will thus be processed until the job reaches the head of the queue and starts its run.

**Note:** If SYS$COMMAND is used in a command procedure being run in the Unicenter Job Management Manager batch mode (instead of to OpenVMS batch mode without the manager), it may run the command file twice.
Batch Mode Logicals

The following logicals supported by the manager provide flexibility around Batch job support:

**SCHED$BATCH_KEEP_LOG**
If TRUE, the log files created by Unicenter Job Management Manager jobs run in BATCH queues are kept. Otherwise, these log files are deleted when the job completes. This logical is defined initially in UJM$MANAGER$STARTUP.COM. The default value for this logical is TRUE.

**SCHED$BATCH_PRINT_LOG**
If TRUE, the log files created by Unicenter Job Management Manager jobs run in BATCH queues are printed to SYS%PRINT. Otherwise, the log files are not printed. This logical is defined initially in UJM$MANAGER$STARTUP.COM. The default value for this logical is FALSE.

**SCHED$BATCH_NAME_PREFIX**
You can use this logical to override Unicenter Job Management Manager’s batch name prefix. If you define this logical, the value of it is used as the prefix to the batch job name. If you do not define this logical, the default value SCHEDULER is used. This logical is not defined by UJM$MANAGER$STARTUP.COM.
Unicenter Job Management Manager in an OpenVMS Cluster

You can run Unicenter Job Management Manager jobs only on a node where the manager is running. This rule also applies to OpenVMS Cluster nodes.

To see if the manager is running on your node or OpenVMS Cluster, enter the DCL command SCHEDULE SHOW STATUS. To see if a Unicenter Job Management Agent is running on a remote node, use the /REMOTE_NODE=remote_node qualifier.

On an OpenVMS Cluster, you can enable a job to run:
- On only one particular node
- On any node
- On a subset of nodes

You can specify a node for a job’s execution by using the /NODE (/CLUSTER_NODE) or /REMOTE_NODE qualifier when creating, copying, or modifying a job.

You can force a job to run manually on a particular node regardless of any node restriction in the job database. To do this, specify the /NODE (or /CLUSTER_NODE) qualifier with the SCHEDULE RUN command.

You can specify a subset of cluster nodes for a job’s execution by using the /LOAD_BALANCE_GROUP qualifier when creating, copying, or modifying a job.

The maximum number of nodes that the manager can support in an OpenVMS Cluster is 200. This feature of the manager is designed to accommodate any future OpenVMS Cluster support increases up to 200 nodes.

The manager is supported on homogeneous and mixed-mode OpenVMS clusters. You should have only one active SYSUAF.DAT file in an OpenVMS Cluster. Use of more than one SYSUAF.DAT file within an OpenVMS Cluster is not supported by Computer Associates (see the OpenVMS Cluster Systems Manual).

How the Default Node Runs a Unicenter Job Management Manager Job

When you run the manager on multiple nodes of an OpenVMS Cluster, one node becomes the default executor. If load balancing is turned off, this node runs all jobs that do not have a node restriction. If load balancing is turned on and the logical name NSCHED$LBAL$WAIT_AVAL_NODE is not defined (default) or is set to FALSE, a job that cannot be scheduled to any node in its Load Balance group will run on the default node.
Normally, the first node in the OpenVMS Cluster that starts the manager becomes the default executor; however, the system manager can control this by using the SCHEDULE SET DEFAULT command.

If the default executor node fails or the manager is stopped on that node, another node takes over this function.

To see which node is the current default executor, enter the SCHEDULE SHOW DEFAULT command.

**Supporting Batch Mode Jobs in an OpenVMS Cluster**

To support batch mode jobs in an OpenVMS Cluster, you should make all batch queues accessible to all nodes in the cluster. If this is not desirable, set up all queues to be accessible to the default node.

If you use the SHOW JOB command from a node that cannot access the batch queue for the job, the command will not be able to find the job.

**Balancing Job Loads Among Nodes in an OpenVMS Cluster**

Unicenter Job Management Manager provides the opportunity to use dynamic load balancing in an OpenVMS Cluster environment, and runs jobs on the machine that has the lowest current system activity. Your system manager can enable or disable this activity.

Load balancing is enabled by default for all systems in an OpenVMS cluster. To enable load balancing, use the SCHEDULE SET LOAD_BALANCE command. When you enable this feature, Unicenter Job Management Manager looks at all machines in the cluster that are currently running the manager and selects the least loaded of these nodes. The manager assigns the job to run on that node. You can also restrict a job to run on a subset of nodes in a cluster using Load Balance Groups. If you assign a Load Balance Group to a job, the job runs on the least loaded of the nodes in the Load Balance Group. All jobs are load balanced unless you turn off load balancing or a job is restricted to a particular node.

To check if load balancing is currently enabled, use the SCHEDULE SHOW LOAD_BALANCE command.

For a description of how load balancing works, see the chapter “Getting Started with Unicenter Job Management Manager.”
The manager uses a currently least-loaded node approach to determine which node to run a job on. For more information on the algorithm the manager uses, see the chapter “Getting Started with Unicenter Job Management Manager.” If you must customize further, you can invoke a command procedure to use a different method to assign jobs to nodes in a cluster. For more information on how to specify your own load balancing algorithm, see the appendix “Customizing Load Balancing.”

Recovering Jobs from Nodes That Fail

If a node fails while a job is running, you may want to restart the job on another node. Or, you may decide to put the job on hold and notify the job’s owner to perform manual cleanup.

You can control whether or not to restart a job by specifying the /RESTART or /NORESTART qualifier with the DCL commands SCHEDULE CREATE, SCHEDULE MODIFY, or SCHEDULE COPY, or by choosing Restart options in the DECwindows interface.

You can also restart a job from a particular checkpoint in the job. To set up checkpoints, use the SCHEDULE SET RESTART_VALUE command in your DCL command procedure.

If a node on which the manager is running fails, and the manager is running on at least one other node in the OpenVMS Cluster, the manager:

- Updates the status of any interrupted jobs to aborted.
- Notifies users of the failure.
- Restarts the job, if another CPU is available and if the job has been set with the /RESTART qualifier.

The manager evaluates the error messages it receives and determines whether the failure is due to its inability to create a detached process or to the job itself failing. If a job has /RESTART set and fails because of a system error that prevents creation of an OpenVMS process, the job is rescheduled according to its interval; /RETRY has no impact on when the job is rescheduled. If the job was created with the /NORESTART qualifier, the job is put on hold and is not restarted automatically.
Overview

Unicenter Job Management Manager (the manager) is a powerful and flexible tool. When you use the manager, you can choose from a variety of options and customize the manager to fit the way you do business.

This chapter covers the following topics and points you to additional information:
- Roles and responsibilities
- User interfaces
- Steps leading toward automation
- Controlling job access
- The callable interface (SDK)
- System management and normal maintenance
- Unicenter Job Management Manager/Agent performance tuning
- Load balancing

Roles and Responsibilities

With Unicenter Job Management Manager, Operations people need to perform fewer repetitive chores manually. They will need to understand their new roles and responsibilities.

You should decide at the outset the person or persons who will do the following:
- Convert existing procedures to run under the manager. They must understand the business processes, dependency networks, and the jobs that are going into the system.
- Oversee operations until new procedures run smoothly.
- Monitor operations after the system is set up and running correctly.
These roles may be full-time jobs, depending on the complexity of your production schedules.

**User Interfaces**

The manager’s flexibility allows you to choose from two user interfaces. The following table can help you select the interface to use:

<table>
<thead>
<tr>
<th>Use this interface...</th>
<th>If you need to...</th>
</tr>
</thead>
<tbody>
<tr>
<td>DCL</td>
<td>Initiate and monitor operations using general and system management commands.</td>
</tr>
<tr>
<td></td>
<td>Create dependencies.</td>
</tr>
<tr>
<td>DECwindows Motif</td>
<td>Create, modify, and monitor jobs as a general user.</td>
</tr>
<tr>
<td></td>
<td>Create dependencies for complicated job streams as a general user.</td>
</tr>
<tr>
<td></td>
<td>Obtain a graphical view of Unicenter Job Management Manager jobs.</td>
</tr>
</tbody>
</table>

**Steps Leading Toward Automation**

A major benefit of Unicenter Job Management Manager is its ability to automate time-consuming and labor-intensive tasks. The first steps toward automation should include:

- Understanding your own production schedules, dependency networks, and what needs to be automated
- Asking yourself what would happen if:
  - A job is run by mistake or out of sequence
  - A job does not run when you want it to
  - System time is set incorrectly
  - A dependency is removed from a job by mistake
- Devising a naming convention to let you use wildcards on groups of jobs across accounts
- Dividing jobs into steps so they can take advantage of FAILOVER/RESTART at a step
- Collecting commonly used functions into prefunctions and postfunctions that can be shared among jobs
- Modifying existing procedures to remove extraneous logic, such as for rescheduling, job dependency, or error notification
- Checking error handling and job exiting status
- Using job dependencies and load balancing for “parallel processing”
- Putting some simple, non-critical jobs into the job database in order to become familiar with how the manager works
- Devising a logical grouping scheme that takes advantage of the manager’s “GROUP” and “TYPE” capabilities, over and above the wildcard capability
Controlling Job Access

Unicenter Job Management Manager provides flexibility for security, allowing you to grant specific job access by specific users to specific jobs.

There are two major ways to control job access:

- UIC privileges
- Identifiers

For a description of UIC privileges, see the Chapter “An Overview of Unicenter Job Management Manager.”

Identifier-Based Access to Jobs

In addition to the UIC privilege-based security scheme, you can control job access using identifiers. Each Unicenter Job Management Manager job can have the following identifiers:

- READ
- WRITE
- EXECUTE

If the requesting process also holds that identifier, then access is granted. This feature allows access control to individual Unicenter Job Management Manager jobs on a user-by-user basis, and eliminates the need for privileges for operations personnel. It also removes the need for privileged proxy accounts for remote control of privileged jobs.

<table>
<thead>
<tr>
<th>These identifiers...</th>
<th>Also permit these accesses...</th>
</tr>
</thead>
<tbody>
<tr>
<td>WRITE</td>
<td>EXECUTE and READ</td>
</tr>
<tr>
<td>EXECUTE</td>
<td>READ</td>
</tr>
</tbody>
</table>

The identifiers that are supported in the manager are “general identifiers,” or identifiers that can be created with the OpenVMS AUTHORIZE utility and stored in the file RIGHTSLIST.DAT:

- ADD/IDENTIFIER: OpenVMS AUTHORIZE command to create an identifier
- GRANT/IDENTIFIER: OpenVMS AUTHORIZE command to grant an identifier to a user
Identifier qualifiers do not appear in the DCL user interface as prompts to the CREATE, MODIFY, or COPY commands; they must be explicitly specified on the command line. In the DCL interface, the following qualifiers control the identifiers:

- /RDID, for READ access
- /EXID, for EXECUTE access
- /WRID, for WRITE access

Identifier qualifiers appear in the DECwindows user interface.

The following privileges are required to set job identifiers:

- WRITE access to the job is required to set the READ identifier.
- SYSPRV privilege is required to set the EXECUTE identifier.
- CMKRNL privilege is required to set the WRITE identifier.

Only one identifier value is supported for each of the identifier access qualifiers.

**Mixed Environments**

In mixed computing environments, users without system privileges may have security problems initiating and controlling jobs.

One solution is to fill in the following command procedure template, and request that a person with SYSPRV privileges run it.
## Unicenter Job Management Manager—Job Scheduling Information Sheet

Use this sheet to help track your job scheduling Information:

* = optional

### Job Command Information
- **Main Function to Run:**
  - * Prefunction to Run:
  - * Postfunction to Run:

### Job Information
- **Job Owner Name:**
- **Job Name:**
  - * Group Name:
  - * Type Name:
  - * Node to Run Job on:
  - * Remote Node to Run Job on:

**Detached/Batch/Remote Mode to Run Job:**
- **Retain Job upon Success/Failure/All/None:**
  - * Cluster Nodes to restrict job to LOAD_BALANCE_GROUP:

### Schedule Information
- **Start Time:**
- **Interval:**
- **Days of Week:**
  - * Special Day Classes:

### Notification Information
- **Send Mail on Success/Failure/All/None:**
  - * Send Mail on Special Day Action:
  - * Mail Addresses:

**Terminal Broadcast Message:**
- **OPCOM Message:**
| Error Recovery Information | Restart on Crash:  
|                           | Retry on Job Failure:  
|                           | * Retry Interval:  
|                           | * Retry Quantity:  
|                           | * Stall Notify  
|                           | * Job to Run When Stalled (SJOB):  
|                           | * Max Time Notify:  
|                           | * Job to Run When Max Time Exceeded (TJOB):  
| Logging Information       | * Output Logfile Name:  
| Job Access Security Information | * Read Access Identifier (RDID):  
|                           | * Execute Access Identifier (EXID):  
|                           | * Write Access Identifier (WRID):  
| Other Job Run Information | * Dependent on What Other Jobs (SYNCHRONIZATION):  
|                           | * Run Priority:  
|                           | * Comment  
| Batch Queue Execution Specific Information | Queue to Run Job:  
|                           | * Queue Priority (QPRIORITY):  
|                           | * CPU Limit for Job:  

The Callable Interface (SDK)

Unicenter Job Management for OpenVMS supports a callable software developer’s kit (SDK) on OpenVMS. This interface lets you write programs that access Unicenter Job Management for OpenVMS. During installation, the library files NSCHED_SUBS.OLB and CLIB.OLB are placed in the NSCHED$EXE directory. These files contain libraries of subroutines and C utilities that you can call to access Unicenter Job Management features and functions from within the program.

In addition to the API library, the following files are placed in the NSCHED$DATA directory when you install the callable interface option:

- VSSDEFS.H
- HCIDEF.H
- HCISELECT.H
- NSCHED_JOB_FIELDS.H
- EXAMPLE_CREATE.C

For more information about the callable interface, see the *Unicenter Job Management for OpenVMS 164 r3 SDK Guide*.

System Management and Normal Maintenance

This section contains some hints from experienced Unicenter Job Management Manager users.

System management is simplified with the manager. However, Unicenter Job Management Manager detached processes behave differently from commands running under OpenVMS batch mode. Comparing Unicenter Job Management Manager Detached Processes with OpenVMS Standard Batch Processes in Chapter 1, “An Overview of Unicenter Job Management Manager,” contains a detailed comparison between the manager and OpenVMS Batch Processing.

Because privileged operators can modify or delete jobs, privileges should be used with caution. As an alternative, you might consider using EXECUTE identifiers, to allow efficient running without privileges.

You can create user-defined keys for frequently used Unicenter Job Management Manager DCL commands.
At a minimum, operators should know how to do the following:

- Tell what jobs are running. For example:
  ```
  $ SCHED SHOW JOBS/STATUS=RUNNING
  ```
- Abort a job
- Hold or release groups of jobs (in case a problem arises)
- Set or clear dependencies for jobs to resume the production cycle

The following hints can help you perform normal maintenance:

- If the log file grows beyond 5000 blocks, it will slow product performance. Use the following command to close the log file: This command renames the file to filename.OLD and creates a new version of the file:
  ```
  SCHED CLOSE LOG
  ```
  This command renames the file to filename.OLD and creates a new version of the file.
- To include summary information in the new file, use this command:
  ```
  SCHED CLOSE LOG/SUMMARIZE
  ```
- You may want to create a Unicenter Job Management Manager job to execute this command at regular intervals. You could also write a procedure like the following and run it daily:
  ```
  $ SCHED_LOG = "NSCHED$:VERMONT_CREAMERY.LOG"
  $!
  $ IF F$FILE(SCHED_LOG,"EOF") .GT. 2006
  $    THEN
  $        SCHED CLOSE LOG_FILE
  $        MAIL NL: SYSTEM/SUBJECT="THE SCHEDULER LOG FILE HAS BEEN CLOSED"
  $    ENDIF
  $ EXIT
  ```
- The job database becomes fragmented if many jobs are added and deleted. Use the following command to show the number of deleted jobs:
  ```
  $ SCHED SHOW DELETES
  ```
- If the number of deleted jobs is greater than 250-300, stop the manager, and then use the following command to run a program that defragments your job database:
  ```
  $ SCHEDULE OPTIMIZE DATABASE
  ```
  You must restart the manager after running OPTIMIZE DATABASE.
- You can stop the manager while jobs are running as long as it starts again before they complete.
- If a job completes while the manager is stopped, the job will finish normally, but the manager may get a false “job was aborted” status, and may do a job restart if the job is set up to restart.
■ Use the command SCHED SHOW SCHEDULED_RUNS to predict future runs of specified jobs. This command uses the historical job run data to predict the job run schedule, and provides an output qualifier that allows you to print a hard-copy report of the schedule. See the Unicenter Job Management for OpenVMS I64 r3 Reference Guide for additional information and associated qualifiers for this command.

■ Use the command SCHED SHOW HISTORY for information about the execution history of selected jobs. The history log name can be specified; by default the current log is used to extract the requested information. See the Unicenter Job Management for OpenVMS I64 r3 Reference Guide for additional information and associated qualifiers for this command.

**Dependent Jobs Relying on a Single Condition**

You can use a postfunction to create a conditional situation between two jobs. For example, after Job A completes, and if a single condition is met, you want Job B to execute.

If you want a dependent job to run only after one specific ending condition from the main function, use a simple DCL procedure similar to the following:

```dcl
$ IF NSCHED_STATUS .EQ. the-condition-you-want
$ THEN
$ EXIT 1
$ ELSE
$ EXIT 0
$ENDIF
```

**Synchronizing Local and Remote Databases**

For functions that involve timing between different nodes, such as maximum run time and start time for remote or batch mode jobs, system times must be synchronized.

If you are concerned about synchronizing local and remote databases, there are at least two areas of synchronization to consider:

■ Time synchronization

For time synchronization, simply check the time of each server initially. The manager does not do any time correction for remote sites. Remote job dependencies occur because the remote dependency completed, and sent a RUN message across the net to the local dependent (or vice versa), *not* because of any time synchronization.

■ Job dependency synchronization
For job dependency synchronization, make sure of the following:

- The remote account’s proxy is set up for the local account.
- The reference in the SYNCHRONIZATION qualifier for remote servers is correct.

The manager will do the rest for you.

**Activating the Debug Log File**

Activate the debug log file if you are having a problem, and need to track messages, actions, and times.

Follow the steps in the table below to activate the debug log the next time the manager starts. If you want to turn on debugging immediately, use the SCHED SET DEBUG ON command.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Edit the startup procedure SYS$STARTUP:UJM$MANAGER$STARTUP.COM.</td>
</tr>
<tr>
<td>2</td>
<td>Locate the line that tells the manager to start up in debug mode, and make sure this line is no longer commented out.</td>
</tr>
<tr>
<td>3</td>
<td>Restart the manager.</td>
</tr>
</tbody>
</table>

Turning debugging on creates a log file that describes messages, actions, and times. One log file is created in NSCHED$DATA for each machine running the NSCHED process. The file is called ‘nodename’.LOG.

In most cases the log file is fairly small. However, the log file that belongs to the default manager could get as large as 5000 blocks. To free disk space, simply purge the log file. The manager creates a new log file at each startup, and purges the log files to limit them to two versions.

You need not create log files until you have a reason to use them. In general, if you have plenty of free space, write the log files.
Load Balancing

Load balancing depends on the system’s rating.

Rating a System

The system rating is the average between the Memory_rating and the CPU_rating. When jobs are ready for execution, they find the node with the highest rating, and send the job to that node.

The algorithm for calculating ratings follows:

Total Rating = Cpu_rating + Memory_rating

Cpu_rating = Cpu_calculation * CPU_weight * (1 + ((number of CPUs - 1) * .2)) / number of CPUs

Memory_rating = Memory_calculation * Memory_weight

Cpu_calculation = (%Free CPU * (VUPS per CPU) * #CPUs * COM-FACTOR) + (3 * (CPUs* VUPS per CPU))

COM-FACTOR = 0.5 if the ((number of COM+CUR+COMO processes on the system)-1) is more than the number of CPUs

COM-FACTOR = 1.0 if the ((number of COM+CUR+COMO processes on the system)-1) is equal to the number of CPUs

COM-FACTOR = 1.5 if the ((number of COM+CUR+COMO processes on the system)-1) is less than the number of CPUs

Memory_calculation= (FREE_PAGES/TOTAL_PAGES) * MEG * 10

If Current Jobs is greater than or equal to MAX_JOBS, then rating = 0

CPU_weight and Memory_weight have values 0 through 1.

To view the “VUPS per CPU” rating of the system, use the following command:

$SCHEDULE SHOW CPU_RATING

This command displays the CPU (VUPS) rating of the system used in the algorithm’s calculation. For example, the command returns the following for a DS20E:

$SCHEDULE SHOW CPU_RATING
Machine Name <XYZ> Hardware Name <COMPAQ AlphaServer DS20E 5080 MH>
Hardware Model <1921> Rating <1000>

If the system does not have a CPU rating in the Unicenter Job Management CPU database, Unicenter Job Management returns a message saying the CPU is not rated. If you see this message, contact CA Technical Support and provide them with the text of the message. The following is a sample message for an unrated machine:

$SCHEDULE SHOW CPU_RATING
Machine Name <XYZ> Hardware Name <COMPAQ AlphaServer DS20E 5080 MH>
Hardware Model <1921> is not rated

When jobs are loaded, the manager identifies the node with the highest rating and loads the first job on that node. Then the manager checks to see which node has the highest rating and loads the next job onto that node. Each time the manager determines the node with the highest rating, it checks the node’s MAX_JOBS value (the maximum number of jobs allowed) before loading the job. Jobs are loaded on each node until that node’s MAX_JOBS value is reached.

A node’s rating is updated:

- Every NSCHED$LBAL$INTERVAL seconds
- Every time a job starts on that node
- Every time a job completes on that node

Note: We do not recommend having an NSCHED$LBAL$INTERVAL interval of calculation below 5 seconds. The resources used to calculate the ratings become high, and the return on these resources is low.

The rating is calculated only on the node where the job state changes. If you want to use load balancing on a particular node, you will get an accurate rating for it after the job is started, or after its regular update.

There is no minimum rating a node must have in order to have a job started on it. To remove a node from load balancing, set the rating weights for that node to 0. If the rating is 0, the node is not used in load balancing. When a node has reached its MAX_JOBS value, its rating is zero.

How Load Balance Groups Work

You can balance a job load further by specifying groups of nodes in a cluster that certain jobs may run on. To specify these groups, follow these steps:

1. Define a Load Balance Group using the following command:
   
   "$SCHEDULE CONFIG CREATE LOAD_BALANCE_GROUP$

2. Add one or more nodes to the group using the following command:

   "$SCHEDULE CONFIG ADD NODE /LOAD_BALANCE_GROUP$

3. Add the Load Balance Group name to the job definitions using the following command:

   "$SCHEDULE CREATE /LOAD_BALANCE_GROUP$

   or

   "$SCHEDULE MODIFY /LOAD_BALANCE_GROUP$
Note: A Load Balance Group name can have 14 alphanumeric characters. The name can also include an underscore ‘_’.

Scheduling Notes

The following notes provide further information about scheduling load balancing and Load Balance Groups. These scenarios assume the manager is installed on all nodes in a cluster.

Default Behavior, Cluster
By default, load balancing is enabled for all systems in a cluster. If no Load Balance Group is specified for a job on a cluster, the job is scheduled to all nodes in a cluster.

Default behavior, standalone
By default, load balancing is disabled on non-clustered systems. Load Balance Group information for a job is ignored.

No Load Balance Group nodes available
When a job is scheduled to run but nodes are not available in the Load Balance Group, the job’s behavior is based on the setting of the logical NSCHED$LBAL$WAIT_AVAIL_NODE. If this system logical is TRUE, the job moves to the Job Slot Wait state until a node is available in the Load Balance Group. If this system logical is FALSE, the jobs run on the default node in the cluster.

Empty Load Balance Group
A Load Balance Group definition may be empty. In this case, all nodes in the cluster are Unselected, so the job does not run on any machine. If the system logical NSHCED$LBAL$WAIT_AVAIL_NODE is TRUE, the job moves to the Job Slot Wait state until a node is available in the Load Balance Group. If this system logical is FALSE, the jobs run on the default node in the cluster.

Deleted Load Balance Group
Deleting a Load Balance Group removes any reference to that group by a job definition. Those jobs begin to schedule to all nodes in the cluster. If you do not want this scheduling, do not delete a Load Balance Group as a first step. You can modify the jobs to assign them to another Load Balance Group or remove all nodes from the Load Balance Group. You can use the following command to help understand the impact of deleting the Load Balance Group:

```
SCHEDULE SHOW JOB */LOAD_BALANCE_GROUP=group-name-to-be-deleted
```

This command shows you all jobs associated with the Load Balance Group.
Group specification override
The job cluster_node field, if not empty, overrides the group specification. This job runs on the specified node, regardless of the Load Balance group assigned to the job, whether the node is a member of that Load Balance group or not.

Batch and Remote Mode
A job defined with a mode of Batch or Remote is not eligible for Load Balancing. The selection of a load balance group in the Auxiliary Job Definition window is disabled. The Group Editor button remains active.

Special Case Job and Load Balance Group Definitions
The following are special cases with job and Load Balance Group definitions.

- **A node with group definitions and jobs referencing these groups is moved from a cluster to standalone:** In the Motif interface, you can create Load Balance group definitions; however, only the local node is available to add to a Load Balance group. If a node is removed from a group, it is temporarily added to the list of Unselected Nodes; however, when the job modification is complete, it is deleted from the available list. In the Config CLI interface, any node may be added or removed from a group (see SCHEDULE CONFIG ADD NODE). For scheduling, load balancing is disabled by default on a standalone node. A job may only run on the standalone node.

- **A node with group definitions and jobs referencing these groups is moved from a cluster to another cluster:** A job referencing a group with non-existing nodes does not load balance to nodes that do not exist in the current cluster. In the Motif interface, group definitions may be created and deleted; however, only cluster nodes from the new cluster are available to add to any group. If a node from the former cluster is removed from a group, it is temporarily added to the list of Unselected Nodes; however when the job modification is complete, it is deleted from the available list. In the Config CLI interface, any node may be added or removed from a group (see SCHEDULE CONFIG ADD NODE). More information, see the section Scheduling Notes.

- **A standalone node with no group definitions:** In the Motif interface, you can create group definitions; however, only the local node is available to add to any group. In the Config CLI interface, you can add or remove any node from a group (see SCHEDULE CONFIG ADD NODE). Load balancing is disabled by default on a standalone node. A job can only run on the standalone node.

- **A cluster node with no group definitions:** In the Motif interface, group definitions may be created using nodes available in the cluster to add to any group. In the Config CLI interface, any node may be added or removed from a group (see SCHEDULE CONFIG ADD NODE). Load balancing is enabled by default. For more information, see the section Scheduling Notes.
To accommodate the diversity of environmental conditions that may exist at different installation sites, Unicenter Job Management can tune the communication code that lets the manager and the agent communicate.

Sites with slow networks, unreliable networks, heavily burdened nodes, or heavy spikes in CPU utilization may need to adjust these parameters. Tuning parameters have the same names for the manager and for the agent.

These parameters may be logical names or symbols. If the parameters are system logical names, they affect the NSCHED, SCHED$LISTENER retry, and user interface processes. If you want different parameters for these processes, use symbols or process logical names created in the process’s startup file.

The following table lists the parameters with their possible settings:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Minimum</th>
<th>Maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHED_PACKET_WAIT</td>
<td>2 sec</td>
<td>1 sec</td>
<td>60 sec</td>
</tr>
<tr>
<td>SCHED_MAX_RETRIES</td>
<td>3</td>
<td>0</td>
<td>32</td>
</tr>
<tr>
<td>SCHED_PENDING_DELAY</td>
<td>60 sec</td>
<td>1 sec</td>
<td>–</td>
</tr>
</tbody>
</table>

SCHED_PACKET_WAIT and SCHED_MAX_RETRIES work together. When one component (manager or agent) tries to communicate with the other, the component tries to connect. If it fails to connect, the component waits the amount of seconds set in SCHED_PACKET_WAIT and tries again. The component repeats this process a number of times equal to SCHED_MAX_RETRIES.

Note: Since packet communication is synchronous, the sending process waits a maximum of SCHED_PACKET_WAIT * SCHED_MAX_RETRIES seconds before ending attempts to send a packet. If you set both parameters high, the component may wait an unacceptably long time before starting other work. A system that has many jobs starting or finishing within a short time of one another requires higher values for these parameters.
Chapter 4: Using the DCL Command Interface

Overview

This chapter describes how to use Unicenter Job Management Manager (the manager) with DCL commands. The chapter covers the following topics:

- Accessing the manager and entering commands
- General and management commands
- Creating a Unicenter Job Management Manager job
- Creating job dependencies
- Assigning a job to a group or type
- Special days
- Sending OPCOM messages
- Creating a job in batch mode
- Summary of Unicenter Job Management Manager commands
Unicenter Job Management Manager commands are divided into general commands for users and management commands for system managers. All Unicenter Job Management Manager commands are available at the DCL command level, if you have privileges to use the command.

You can use the following ways to enter commands at the DCL command level:

- **From the DCL prompt ($)**
  
  All general Unicenter Job Management Manager commands begin with the word SCHEDULE. Example:
  
  ```
  $ SCHEDULE SHOW JOBS
  ```

- **From the SCHEDULE> prompt**
  
  If you enter the command SCHEDULE at the DCL prompt and press Return, you invoke the manager as a subsystem. The SCHEDULE> prompt is displayed. You can enter Unicenter Job Management Manager commands without the word SCHEDULE. Example:
  
  ```
  $ SCHEDULE
  SCHEDULE> SHOW JOBS
  ```
  
  To return to the DCL prompt, use the EXIT command or press Ctrl+Z.

- **From the SCHEDULE Config> prompt**
  
  Enter the SCHEDULE Config command for the subset of commands used to configure Load Balance Group definitions:
  
  ```
  $ SCHEDULE CONFIG
  SCHEDULE Config> CREATE LOAD_BALANCE_GROUP GROUP1
  ```
  
  To exit the SCHEDULE Config> prompt, type EXIT twice.

You can abbreviate the commands according to standard DCL abbreviation rules. If an abbreviation is unrecognized or ambiguous, the system displays an error message. If you omit a required parameter to a command, the manager prompts for it.

Recall of commands is supported via standard DCL rules.

---

**Is Unicenter Job Management Manager Installed?**

To check if the manager is installed on your system and to see which nodes of an OpenVMS Cluster currently have the manager running, enter the following command:

```
$ SCHEDULE SHOW STATUS
```

If the manager is not installed, contact your system manager for more information.
To see whether a remote agent is installed on a remote node running another operating system, use the following command:

$ SCHEDULE SHOW STATUS/REMOTE_NODE=nodename

Using Help

This document describes all Unicenter Job Management Manager commands. You can also get help online by entering either of the following commands:

$ HELP SCHEDULE
$ SCHEDULE HELP

General and Management Commands

Unicenter Job Management Manager commands are divided into two groups, for users and system managers. For the system privileges required to use each group of commands, see Privileges Needed to Use Unicenter Job Management Manager in the chapter “An Overview of Unicenter Job Management Manager.”

General Commands

General commands are for Unicenter Job Management Manager users. They allow you to:

- Create or copy a new job into the Unicenter Job Management Manager database.
- Run, abort, delete, or hold a job.
- Display information about a job.
- Modify an existing job.
- Override a job’s normal characteristics for one specific run.
- Add a job to the dependency list of another job. You must have READ access to the dependency job.

For a summary of commands, see the Summary of Unicenter Job Management Manager Commands. For a description of individual commands, see *Unicenter Job Management for OpenVMS I64 r3 Reference Guide*.
Management Commands

Management commands are for system managers. They allow you to set up, monitor, and manage the Unicenter Job Management Manager environment, on an OpenVMS Cluster or among remote nodes on your network. For example, management commands let you set the following:

- The default node for running the manager on an OpenVMS Cluster, for routine or failover job activity
- The default priority of Unicenter Job Management Manager jobs
- The Unicenter Job Management Manager load-balancing feature on a local OpenVMS Cluster
- The maximum number of Unicenter Job Management Manager jobs that can run on all nodes or on a specific node on the OpenVMS Cluster
- The time interval and expiration time for resending job-dependency notifications between remote nodes, when a network communication failure occurs
- The type of information put in the event log

Management commands also let you:

- Close and rename the event log
- Delete pending attempts to resend job-dependency notifications on remote nodes
- Run the event-log reporting program
- Stop the manager on an OpenVMS Cluster, on a specific node of an OpenVMS Cluster, or on a specific remote node

Most management commands begin with the word SCHEDULE. However, some management commands are standard DCL commands that perform a specific task in support of Unicenter Job Management Manager.

For a summary of commands, see the Summary of Unicenter Job Management Manager Commands. For a description of individual commands, see *Unicenter Job Management for OpenVMS 164 r3 Reference Guide*. 

Creating a Unicenter Job Management Manager Job

To create a Unicenter Job Management Manager job, use the SCHEDULE CREATE command. When you create the job, you can assign a job name and specify other information about the job such as:

- Output file
- Specific node on which to run the job
- Schedule interval
- Days of the week on which the job may run

The following is an example of how to create a job with the SCHEDULE CREATE command. When you use the /PROMPT qualifier with the command, the manager prompts you for all the information you can specify about that job.

```
SCHEDULE> CREATE/PROMPT
_VMS Command: @SYS$DEVICE:[EXAMPLE.PROJECT-C]WEEKLY-COPY.COM
_Job Name [None] : WEEKLY-RENAME _Group [None] : WEEKLY
_Type [None] : PROJECT-COSTS
_Stall Notify [None] : 
_Schedule Interval [None] : F W6 18:00:00
_Days [ALL]: (NONE,FRI)
_Special Day Restrictions [NONE]:
_Start Time [ 7-AUG-2005 18:00:00.04] :
_Output file [None] : SYS$DEVICE:[EXAMPLE.PROJECT-C]WEEKLY-RENAME.REP
_Mode (Detached, Batch, Remote [Detached] :)
_Cluster Node [Default] :
_Retain (Success, Error, None or All [ALL]:) ALL
_Restart (Yes, No [Yes]): YES
_Retry (Yes, No [No]): YES
_Notify (Yes, No [Yes]): NO
_Send Mail (All, Error, Success or None [NONE]): ALL
_Send MAIL on Special Day Action (Yes, No [No]):
_Use next time (Yes, No [No]): YES _OPCOM (Yes, No [No] :)
_Mail Address [EXAMPLE] : EXAMPLE
_User Name [EXAMPLE] : EXAMPLE
_Run Priority [Default] :
_Pre Function [None] : DIR/PRINT[EXAMPLE.PROJECT-C]*.REP
_Post Function [None] : DIR/PRINT[EXAMPLE.PROJECT-C.WEEKLY]*.REP _
_Maximum Time Warning [None] :
_Maximum Time Job [None] :
_LBAL Group [None] :
_Synchronization [None] :
_Comment [None] : Check for weekly rep's/copy to subdirectory and rename/check new rep files
%SCHED-I-RQSTSUCSS, Job 10521 - Created
```
Unsupported Job Name Characters

Unicenter Job Management for OpenVMS does not support the following characters:

/ [ ] ! @ % * " ' : ( ) = , ?

Unicenter Job Management for OpenVMS does not support whitespace or nonprinting characters.

Note: Unicenter Job Management for OpenVMS may not give you an error message for checking these characters. To fix this problem rename your job names.
Creating Job Dependencies

You can specify job dependencies for a job when you create, copy, or modify a Unicenter Job Management Manager job. Job dependencies are other jobs that must complete successfully before the current job can run. You can specify up to 16 job dependencies for a job.

To specify job dependencies, use the /SYNCHRONIZATION qualifier with the SCHEDULE CREATE, SCHEDULE COPY, or SCHEDULE MODIFY command. You can specify a job dependency by its job name or job number in the Unicenter Job Management Manager job database. To specify more than one job dependency, enclose the list in parentheses and separate the dependencies with commas.

Example:
SCHEDULE> MODIFY COPY_IT /SYNCH=(BACKUP,XYZ::RENAME_IT=DOE,XYZ::6)

This command modifies a job named COPY_IT to depend on three other jobs:
- Your own job BACKUP, in your local OpenVMS Cluster
- A job RENAME_IT, owned by user DOE in the OpenVMS Cluster that contains node XYZ
- Job 6 in the OpenVMS Cluster that contains node XYZ

Job-Dependency Restrictions

The following restrictions apply to creating or modifying job dependencies:
- If you have READ access to jobs belonging to other users, you can add these jobs to your job’s dependency list by including the =username specifier with the job name or by specifying the job number.
  
  Example:
  /SYNCHRONIZATION=(BACKUP=SYSTEM,BACKUP=DOE,BACKUP=SMITH)
  /SYNCHRONIZATION=(S7=SYSTEM,161=DOE,566=SMITH)

- You cannot use wildcard characters in job specifiers when creating or modifying a job dependency list with the /SYNCHRONIZATION qualifier.
Job-Dependency Processing Rules

Before a job can run, all jobs on which it depends must run successfully, at a time later than the dependent job’s synchronization time. The synchronization time is either the last time the job’s dependency list was modified, or the last time the job completed — whichever occurred most recently.

For example, if Job C depends on Jobs A and B, then Job C will not run until Jobs A and B have successfully run following Job C’s synchronization time. If Job D is added to Job C’s dependency list, then Jobs A and B, as well as D must run again before Job C can run. This is because Job C’s synchronization time would reflect the time that Job D was added to its dependency list.

Overriding Job Dependencies

You can override one or more job dependencies for a single job run by using the following command:

```
SCHEDULE> SET JOB job-specifier -
_SCHEDULE> /NO_DEPENDENCY=( dependency [, . . . ] )
```

This command tells the manager to treat the specified job dependencies job as having been satisfied for the next run of the job.
Assigning a Job to a Group or Type

You can assign a Unicenter Job Management Manager job to a specific group or type. This feature lets you perform job actions on an entire job group or type, using a single Unicenter Job Management Manager command. You can create or delete groups and types using the DCL interface only.

A group name or type name is a text string of up to 40 characters. For example, you might use DAILY, WEEKLY, or MONTHLY as a group name. You might use PROGRAM, DOCUMENTATION, BACKUP, or PROJECT-COSTS as a type name.

Examples

- This command inserts a job into a group named BACKUP:
  ```
  SCHEDULE> MODIFY job-name/NEW_GROUP=BACKUP
  ```

- This command removes a job from a group:
  ```
  SCHEDULE> MODIFY jobname/NONEW_GROUP
  ```

- This command shows all your jobs that begin with the letter A in group WEEKLY:
  ```
  SCHEDULE> SHOW JOB A*/GROUP=WEEKLY
  ```

- This command shows all jobs in the system whose type is BACKUP:
  ```
  SCHEDULE> SHOW JOB */TYPE=BACKUP/ALL
  ```

- This command shows all jobs belonging to user DOE that are in any group beginning with WEEKLY and any type beginning with BACKUP:
  ```
  SCHEDULE> SHOW JOB *=DOE/GROUP=WEEKLY*/TYPE=BACKUP*
  ```
Special Days

For a description of Special Day support, which allows you to schedule jobs to run only on certain days or not to run on those days, see Special Days in the chapter "How Unicenter Job Management Manager Works." Special Days can be used to restrict jobs from running on company holidays, plant shutdown days, and so forth, or to run jobs only on certain collections of days. This is sometimes referred to as "holiday support."

Defining Special Day Classes

You can define Special Day Classes by creating a named class and then associating a list of date-expressions with it. Special Day Classes are governed by the following rules:

- Special Day Class names are restricted to 40 characters in length
- Class names cannot begin with a number
- They can contain only alphanumeric characters and the underscore character (_)
- The list of date-expressions can consist of one or more absolute date specifications
- You can specify the list of date-expressions associated with a Special Day Class at the time the Special Day Class is created, or add to it later
- You can modify the contents of a Special Day Class after its creation by inserting and removing elements

Acceptable Dates for Special Day Classes

Special Day Classes can contain dates beginning the year 1970 and continuing through the year 2037.

Required Privileges

Only users with OPER or SYSPRV privileges are allowed to create, modify, and delete Special Day Classes.

How to Define Special Day Classes

The following example shows how a Special Day Class is defined in the DCL interface:

SCHEDULE> CREATE MY_CLASS /SD_CLASS -

How to Add Days To Existing Special Day Classes

The following example shows how to add days to an existing Special Day Class.

SCHEDULE> MODIFY/SD_CLASS/DATES=(1-JAN,TOMORROW) classname

How to Remove Existing Days from a Class

The following example shows how to remove existing days from a Special Day Class.

SCHEDULE> MODIFY/SD_CLASS/NODATES=(TODAY,12-DEC-2005) classname
Restriction Expressions: Relating Special Days to Jobs

Once you define Special Day Classes, you can use one or more classes in combination as scheduling constraints for jobs. Defining Special Day constraints for jobs is supported in all the user interfaces of the manager.

You can provide scheduling restraints for jobs by associating a **Special Day Restriction Expression** with a job-specifier. A Special Day Restriction Expression is a list of one or more Special Day Classes that defines one of the following:

- Days on which a job should not run
- Days on which a job is restricted to running

The job-specifier can be a specific job name or use wildcards in the job name. The job-specifier can include a GROUP or TYPE indicator. For example:

```plaintext
SCHEDULE> MODIFY JOBX/GROUP=BATCH -
>SCHEDULE> /SD_RESTRICTION=(COMPANY_HOLIDAYS,PLANT_SHUTDOWNDAYS) -
>SCHEDULE> /NOT_ON
```

You can restrict a job from running on certain days by using the /NOT_ON qualifier in conjunction with the job’s schedule interval. For example:

```plaintext
SCHEDULE> MODIFY JOBX /SD_RESTRICTION=(COMPANY_HOLIDAYS)/NOT_ON
```

This example instructs the manager not to run JOBX on company holidays.

The manager calculates the job’s next scheduled run time according to the job’s schedule interval and then checks against its Special Day Restrictions. If the job’s next scheduled run time falls on a restricted Special Day, the manager applies one of two user-specified Special Day Actions:

- Puts the job on hold
- Skips the scheduled run of the job and applies the schedule interval again to calculate a new next scheduled run time. This is done repeatedly until a day that satisfies the job’s Special Day Restrictions is found.

In both cases, if the job has OPCOM or NOTIFY set, the owner of the job and the operator are notified of the Special Day conflict and what Special Day Action was applied.
Restricting a Job to Run Only on Special Days

You can restrict a job to run only on Special Days by using the /ONLY_ON qualifier. For example:

```
SCHEDULE> MODIFY JOBX/SD_RESTRICTION=(LAST_DAY_OF_FISCAL_QUARTER)/ONLY_ON
```

This example tells the manager to run JOBX only on the days in the class LAST_DAY_OF_FISCAL_QUARTER.

When the manager calculates the job’s next scheduled run time, the job’s schedule interval is applied. The manager then checks to see if the resulting day is a day the job is permitted to run. If not, the manager applies the schedule interval again until it finds a day the job is permitted to run.

If the manager does not find a day on which the job is permitted to run, it puts the job on hold. In either case, if the job has OPCOM or NOTIFY set, the owner and operator are notified of the conflict, and what Special Day Action was applied.

Restriction Expressions Are Mutually Exclusive

You can use either /NOT_ON or /ONLY_ON for any given job. You cannot use both Special Day qualifiers for the same job.

Special Day Actions

Special Day Actions specify what action the manager should take when a job’s scheduled run time happens to fall on a day that is part of a Special Day Class. Special Day Actions are specified on a per-job basis. For example, users can instruct the manager to:

- Skip backups on restricted Special Days
- Put payroll programs on hold to be rescheduled by the operator

Setting a Job’s Special Day Action

Following is an example of how to set a job’s Special Day Action:

```
SCHEDULE> MODIFY MYJOB/SD_ACTION=HOLD
```

SD_ACTION can be HOLD or SKIP.

No Special Day Action Specified

If you do not explicitly specify a Special Day Action for a job, the manager applies the system default action at the time the job’s Special Day Restrictions are created. For example, if you define the system default Special Day Action to be SKIP, then new Special Day Restrictions created for jobs have the default Special Day action of SKIP. If you redefine the system default Special Day Action to HOLD, new Special Day Restrictions have the default Special Day Action of HOLD.
You can redefine the system default by defining the logical variable NSCHED_DEFAULT_SD_ACTION. For example:

$ DEFINE NSCHED_DEFAULT_SD_ACTION HOLD

NSCHED_DEFAULT_SD_ACTION can be HOLD or SKIP. The default as shipped is SKIP.

Redefining the system default Special Day Action does not affect the Special Day Action of jobs with existing Special Day Restrictions.

**Showing Information Related to Special Days**

You can obtain information about the Special Days defined on your system by using the SHOW command. For example:

SCHEDULE> SHOW SD_CLASS name

You can show the Special Day Classes defined on the system, or see the definition of a specific Special Day Class.

When using the SHOW command, Special Day names can contain wildcards.

You can also use the SHOW command to find out what Special Day Restrictions are associated with a job. Job names can also use wildcards, and can include the /GROUP and /TYPE indicators. For example:

SCHEDULE> SHOW JOB/FULL
SCHEDULE> SHOW JOB/GROUP=BATCH/FULL
Sending OPCOM Messages

The Operator Communication Manager is a process for controlling communication between a process and a system operator. The manager lets you automatically send an OPCOM message upon job completion. This feature is part of the notification facility. You can send an automatic OPCOM message from the DCL User Interface by invoking the qualifier /OPCOM. (You can also specify that OPCOM messages be sent in the DECwindows Auxiliary Options dialog box.)

The OPCOM class that the manager uses for notification is the CLUSTER OPERATOR class. The operator messages are sent to an OPC$B_MS_TARGET of OPC$M_NM_CLUSTER.

For example:

```
SCHEDULE> MODIFY job-name/OPCOM
SCHEDULE> RUN job-name
```

This command will result in automatic notification when the job is complete.

Creating a Job in Batch Mode

The manager can use batch as an execution engine instead of using detached jobs. A job must be specially created or modified to use batch mode. The default is /MODE=DETACHED.

The following examples show how to create a job in batch mode:

```
SCHEDULE> CREATE/MODE=BATCH/QUEUE=SYS$BATCH
```

This example creates a batch job without using the /PROMPT qualifier, and prompts only for a standard subset of qualifiers. Refer to the Unicenter Job Management for OpenVMS 164 r3 Reference Guide for more details on /PROMPT.

```
SCHEDULE> CREATE/PROMPT/MODE=BATCH/QUEUE=SYS$BATCH
```

In this example the user creates a batch job using the /PROMPT qualifier, and is prompted for a set of qualifiers.

The SCHED SHOW command will not display attributes that are not allowable for that job’s current MODE.
Summary of Unicenter Job Management Manager Commands

The following two sections briefly describe all the commands in the manager. For complete descriptions and examples, see Unicenter Job Management for OpenVMS I64 r3 Reference Guide. If you enter commands at the DCL prompt ($), remember to begin each command with the word SCHEDULE.

General Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORT</td>
<td>Stops one or more running jobs.</td>
</tr>
<tr>
<td>COPY</td>
<td>Creates a new job, copying the settings for an existing job.</td>
</tr>
<tr>
<td>CREATE</td>
<td>Creates a new job or a Special Day Class.</td>
</tr>
<tr>
<td>DELETE</td>
<td>Deletes one or more jobs or a Special Day Class from the database. This is a management command when used to delete a Special Day Class.</td>
</tr>
<tr>
<td>HELP</td>
<td>Displays the Help screens for the DCL interface.</td>
</tr>
<tr>
<td>HOLD</td>
<td>Puts one or more jobs on hold.</td>
</tr>
<tr>
<td>MODIFY</td>
<td>Modifies one or more existing jobs or a Special Day Class.</td>
</tr>
<tr>
<td>RELEASE</td>
<td>Takes one or more jobs off hold.</td>
</tr>
<tr>
<td>RUN</td>
<td>Runs the specified jobs, regardless of conditions such as job dependencies.</td>
</tr>
<tr>
<td>SCRIPT JOB</td>
<td>Creates a command procedure capable of recreating the specified job or jobs.</td>
</tr>
<tr>
<td>SET JOB</td>
<td>Overrides and modifies settings that specify how and when to retry a job. Can be used with EXECUTE privilege. (Requires WRITE for DELETE.)</td>
</tr>
<tr>
<td>SET_RESTART_VALUE</td>
<td>Specifies at what point in a job to restart the job, if a system problem occurs.</td>
</tr>
<tr>
<td>SHOW CPU_RATING</td>
<td>Displays the CPU (VUPS) rating of the system.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SHOW DEFAULT</td>
<td>Shows the default Unicenter Job Management Manager node for a local or remote OpenVMS Cluster.</td>
</tr>
<tr>
<td>SHOW DELETES</td>
<td>Shows the number of jobs deleted from the job database since its last compression.</td>
</tr>
<tr>
<td>SHOW DEPENDENCIES</td>
<td>Creates a text file that represents a picture of a job’s dependency structure.</td>
</tr>
<tr>
<td>SHOW FISCAL_YEAR</td>
<td>Displays the fiscal calendar.</td>
</tr>
<tr>
<td>SHOW HISTORY</td>
<td>Displays information about the execution histories of jobs in a given log file.</td>
</tr>
<tr>
<td>SHOW JOBS</td>
<td>Displays information about the specified jobs.</td>
</tr>
<tr>
<td>SHOW JOBS/PROCESS</td>
<td>Displays process-related information for currently running local jobs.</td>
</tr>
<tr>
<td>SHOW JOBS/SYMBOLS</td>
<td>Creates a symbol for each job characteristic for the specified job.</td>
</tr>
<tr>
<td>SHOW LOAD_BALANCE</td>
<td>Shows whether the load-balancing feature for a local or remote OpenVMS Cluster is on or off.</td>
</tr>
<tr>
<td>SHOW LOGGING</td>
<td>Shows the current events being logged for a specific node, all nodes in an OpenVMS Cluster, or remote nodes of a network.</td>
</tr>
<tr>
<td>SHOW MAX_JOBS</td>
<td>Shows the maximum number of jobs that can run simultaneously for a specific node, all nodes in an OpenVMS Cluster, or remote nodes of a network.</td>
</tr>
<tr>
<td>SHOW NAMES</td>
<td>Displays all the group and/or type names that a user currently has assigned for jobs.</td>
</tr>
<tr>
<td>SHOW PRIORITY</td>
<td>Shows the default run-time priority setting for a specific node, all nodes in an OpenVMS Cluster, or remote nodes of a network.</td>
</tr>
<tr>
<td>SHOW SCHEDULED_RUNS</td>
<td>Predicts future execution schedules for jobs based on their historical run data.</td>
</tr>
<tr>
<td>SHOW SD_CLASSES</td>
<td>Displays the contents of requested classes.</td>
</tr>
<tr>
<td>SHOW STATUS</td>
<td>Shows information about the manager operating for a specific node, all nodes in an OpenVMS Cluster, or remote nodes of a network.</td>
</tr>
</tbody>
</table>
## Management Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHECK</td>
<td>Tells a scheduler to do a consistency check on a database and update its internal structures and counters to reflect the database and the current state of the system.</td>
</tr>
<tr>
<td>CLOSE LOG_FILE</td>
<td>Closes and renames the event-log file while the manager is running.</td>
</tr>
<tr>
<td>CONFIG</td>
<td>Creates, modifies, or deletes Load Balance Group definitions.</td>
</tr>
<tr>
<td>DELETE</td>
<td>Deletes one or more jobs or a Special Day Class from the database. This is a management command only when used to delete a Special Day Class.</td>
</tr>
<tr>
<td>DELETE NSCHED$:RETRY.DAT;</td>
<td>Deletes (stops) all remote node notifications currently being retried over the network. This command does not begin with SCHEDULE.</td>
</tr>
<tr>
<td>OPTIMIZE DATABASE</td>
<td>Reclaims unused space and optimizes the jobs database.</td>
</tr>
<tr>
<td>RUN NSCHED$:DB_UTILITY.EXE</td>
<td>Repairs the jobs database. This command does not begin with SCHEDULE.</td>
</tr>
<tr>
<td>RUN NSCHED$:VSS_REPORTS.EXE</td>
<td>Invokes the event-log report utility to select event-log report criteria and display or print a report. This command does not begin with SCHEDULE.</td>
</tr>
<tr>
<td>SET DEBUG</td>
<td>Sets debug logging for the manager.</td>
</tr>
<tr>
<td>SET DEFAULT</td>
<td>Sets the default manager node for a cluster.</td>
</tr>
<tr>
<td>SET FISCAL_YEAR</td>
<td>Defines a fiscal calendar to be used by the manager.</td>
</tr>
<tr>
<td>SET LOAD_BALANCE</td>
<td>Turns the load-balancing feature on or off in an OpenVMS Cluster.</td>
</tr>
<tr>
<td>SET LOGGING</td>
<td>Controls the event classes written to the Unicenter Job Management Manager event-log file.</td>
</tr>
<tr>
<td>SET MAX_JOBS</td>
<td>Sets the limit for the maximum number of jobs that can be run simultaneously.</td>
</tr>
<tr>
<td>SET NETWORK EXPIRATION_RETRY</td>
<td>Sets the maximum time that a job-dependency notification on a remote node can be retried over the network.</td>
</tr>
</tbody>
</table>
## Summary of Unicenter Job Management Manager Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET NETWORK INTERVAL_ENTRY</td>
<td>Sets the interval for retry of notification of job completion on remote nodes during communication failures on a wide area network.</td>
</tr>
<tr>
<td>SET PRIORITY</td>
<td>Sets default run-time priority for jobs.</td>
</tr>
<tr>
<td>SHOW NETWORK</td>
<td>Shows the retry interval, retry expiration time, retry alias, and information about retry operations in progress on the local OpenVMS Cluster.</td>
</tr>
<tr>
<td>STOP</td>
<td>Stops the manager on one or more nodes.</td>
</tr>
<tr>
<td>TYPE NSCHED$::RETRY.LOG</td>
<td>Shows a history of every notification retry event attempted by a remote node. This command does not begin with SCHEDULE.</td>
</tr>
</tbody>
</table>
Chapter 5: Using the Motif Interface

Overview

This chapter describes how to use Unicenter Job Management Manager (the manager) with the Motif interface. This interface allows you to use the mouse to choose general user commands from menus and dialog boxes; the manager’s management commands are not available in the Motif interface.

Before you begin using the Motif interface you should be familiar with the basic DECwindows concepts described in the OpenVMS Documentation.

The first part of this chapter gives you an overview of the Motif interface:

- Using mouse buttons
- Using menus and buttons
- Starting the manager with the Motif interface
- Unicenter Job Management Manager windows and symbols

The second part of the chapter describes how to perform major tasks in the manager:

- Loading jobs to display
- Clearing and changing the currently displayed jobs
- Adding to the currently displayed jobs
- Locating jobs by scrolling
- Viewing job information
- Creating a job
- Creating a job dependency
- Deleting a job dependency
- Controlling a job: aborting, holding, running, and releasing
- Editing a job
- Deleting a job
- Sorting jobs in the Linear Display window
- Creating a graphics file of your display
- Using navigation windows
- Special day classes
Load Balance Groups
Exiting from the Motif interface

The Motif interface uses a resource file to obtain values for several items. The resource file, named SCHEDULER$MOTIF.DAT, must reside in the DECW$SYSTEM_DEFAULTS or DECW$USER_DEFAULTS area.

During the installation, the following resource files are placed in the NSCHED$ directory:

- SCHEDULER$MOTIF_COLOR.DAT — Sample resource file for color systems
- SCHEDULER$MOTIF_BW.DAT — Sample resource file for monochrome (single-plane) systems

Users on monochrome or gray-scale systems MUST copy the file NSCHED$:SCHEDULER$MOTIF_BW.DAT file to their DECW$USER_DEFAULTS directory, and name it SCHEDULER$MOTIF.DAT. Unless this is done, some aspects of the interface may not display properly. Because the color version of the resource file is placed in the DECW$SYSTEM_DEFAULTS directory under the name SCHEDULER$MOTIF.DAT, users on color systems do not need to copy it to their DECW$USER_DEFAULTS directory unless they want to modify the default resource values.

Note: For DECwindows Motif, if you set your monitor to a resolution less than 1024 x 864, you may have to reduce font size to prevent clipping.

The DECW$USER_DEFAULTS area is defined to be SYS$LOGIN by default. Copying NSCHED$:SCHEDULER$MOTIF_COLOR.DAT to DECW$USER_DEFAULTS and naming it SCHEDULER$MOTIF.DAT allows you to change the resource file to meet your preferences without affecting the operation of the interface for other users.

The manager uses the Motif user interface. Old resource files (SCHEDULER$XUI*.DAT) are not used. To prevent those files from interfering with new Motif files, you must remove those files from the NSCHED$ directory, from DECW$USER_DEFAULTS, and from DECW$SYSTEM_DEFAULTS. Also issue the following command and delete those executables to prevent them from interfering:

DECW$SYSTEM_DEFAULTS
Changing the Resource Files

To make changes in the resource files, follow these steps:

1. Use the following command to copy the resource file to your DECwindows defaults directory:

   $ COPY DECW$SYSTEM_DEFAULTS:SCHEDULER$MOTIF.DAT -
   _$ DECW$USER_DEFAULTS:*.*

   By default, the logical DECW$USER_DEFAULTS points to SYS$LOGIN.

2. Open and edit the SCHEDULER$MOTIF.DAT file to modify Unicenter Job Management Manager resources. The file SCHEDULER$MOTIF.DAT has comments describing different parameters that you can change.

3. Test the changes by restarting the DECwindows Motif interface. Repeat this step until the results match what you want.

Motif Interface

The Motif interface for the manager includes three main windows:

- **Graphical Display window** — Displays jobs as boxes that show you the job's current state and the result of its last run. Arrows indicate job dependencies, providing a process flowchart.

- **Linear Display window** — Displays jobs as a list you can sort by job number, job name, or job owner.

- **Real Time Message Display window** — Displays a log of all manager activity that takes place on the system during your Unicenter Job Management Manager session.
Getting Started with the Motif Interface

Before you use the Motif interface, you should become familiar with the functions of mouse buttons, menus, and screen buttons.

Using Mouse Buttons

For the manager, mouse buttons perform the following functions:

<table>
<thead>
<tr>
<th>This mouse button</th>
<th>Lets you...</th>
</tr>
</thead>
</table>
| MB1               | ■ Pull down menus from the menu bar  
|                   | ■ Choose menu items  
|                   | ■ Activate buttons by clicking on them  
|                   | ■ Create job dependencies  
|                   | ■ Select and unselect a job, making it the current object that a menu item acts on  |
| MB2 on a two-button mouse | Display a pop-up menu for job actions, or for deleting a job dependency |
| MB3               | Display a pop-up menu for job actions, or for deleting a job dependency |

Menus are not available in the Real Time Message Display window.

Using Menus and Buttons

The following tables describe the uses of menus and buttons in the Job Display windows:

<table>
<thead>
<tr>
<th>Menu</th>
<th>Uses</th>
</tr>
</thead>
<tbody>
<tr>
<td>File (Linear Display window)</td>
<td>Quit from Unicenter Job Management Manager</td>
</tr>
</tbody>
</table>
| File (Graphical Display window)  | ■ Quit from Unicenter Job Management Manager  
|                                   | ■ Create a graphics file of the window contents |
| Edit (Graphical Display window)  | ■ Load jobs  
|                                   | ■ Clear window  
<p>|                                   | ■ Open Load Balance Group Editor |</p>
<table>
<thead>
<tr>
<th><strong>Menu</strong></th>

</table>
| Edit (Linear Display window) | Load jobs  
|                     | Clear window  
|                     | Open Load Balance Group Editor  
|                     | Sort jobs by job number, job name, or job owner  |

<table>
<thead>
<tr>
<th><strong>Jobs</strong></th>
<th><strong>Uses</strong></th>
</tr>
</thead>
</table>
|                     | Create a job  
|                     | Edit a job  
|                     | Delete a job  
|                     | Display job output  
|                     | Monitor a job  |

<table>
<thead>
<tr>
<th><strong>Control</strong></th>
<th><strong>Uses</strong></th>
</tr>
</thead>
</table>
|                     | Abort a job  
|                     | Put a job on hold  
|                     | Run a job  
|                     | Release a job that is being held  |

<table>
<thead>
<tr>
<th><strong>Day Classes</strong></th>
<th><strong>Uses</strong></th>
</tr>
</thead>
</table>
|                     | Create Special Day Classes  
|                     | Edit Special Day Classes  
|                     | Delete Special Day Classes  |

<table>
<thead>
<tr>
<th><strong>Button</strong></th>
<th><strong>Use</strong></th>

</thead>
<tbody>
<tr>
<td>Load Jobs…</td>
<td>Displays the Load Jobs dialog box (see The Load Jobs Dialog Box section). After you fill in the selection fields and click on OK, the interface fetches the appropriate jobs from the database and adds them to any jobs already displayed in the Jobs windows.</td>
</tr>
<tr>
<td>Clear</td>
<td>Clears all jobs from the Jobs window and removes them from memory.</td>
</tr>
<tr>
<td>Refresh</td>
<td>Redraws the contents of the Graphical Display window.</td>
</tr>
</tbody>
</table>
Starting Unicenter Job Management Manager with the Motif Interface

To start the manager with the Motif interface, enter the following command at the DCL prompt:

```
$ SCHEDULE/INTERFACE=DECWINDOWS
```

Three windows and a dialog box are displayed, as shown in the following figure. The Graphical Display window, Linear Display window, and Real Time Messages Display window have scroll bars for scrolling through displayed information. You can also resize them or minimize them (shrink them to icons).
The Load Jobs Dialog Box

The Load Jobs dialog box lets you select and display jobs from the Unicenter Job Management Manager database.

You select jobs to display by filling in one or more of the fields in the window. You can use wildcard characters (*) in any of these fields.

The jobs you select from the Load Jobs dialog box are displayed in both Jobs windows.

Clicking on OK when the fields are filled in as shown in the figure is equivalent to entering either of the following DCL commands:

$ SCHEDULE SHOW JOBS/USER_NAME=SYSTEM/GROUP=*/TYPE=*/CLUSTER_NODE=*  
$ SCHEDULE SHOW JOBS/USER_NAME=SYSTEM

The Load Jobs dialog box is displayed when you start the Motif interface to Unicenter Job Management Manager. You can display this dialog box at any time during your session by clicking on the Load Jobs... button in the Graphical or Linear Display window.

Refer to Loading Jobs to Display for more information on how to use the Load Jobs dialog box to select jobs to display.
Unicenter Job Management Manager Graphical Display Window

The Graphical Display window provides a graphical display of jobs in the Unicenter Job Management Manager database. Each box shown in this window represents a job. Each job is labeled with its job number above and its job name below. Refer to Interpreting Your Job Display for more information on interpreting your job display.

The Graphical Display window also lets you display a Navigation window that allows you to select and display portions of the window that are not visible, and to change the size of boxes displayed (see Using Navigation Windows).

The menu bar on this window provides the following five pull-down menus:

- **File**
  - Print...
  - Quit

- **Edit**
  - Load Jobs...
  - Clear
  - Load Balance Group Editor...
- Jobs
  - Create...
  - Edit...
  - Delete
  - Display Output...
  - Monitor...

- Control
  - Abort
  - Hold
  - Run
  - Release

- Day Classes
  - Create...
  - Edit...
  - Delete

- Help
  - About

Pressing and holding MB3 on a job box in the Graphical Display window displays a pop-up menu with the same choices found on the Jobs pull-down menu. Moving the pointer over Control and dragging the mouse to the symbol [-> displays a submenu with the same choices found on the Control pull-down menu. To choose one of these submenu items, move the pointer over the menu item you want and release MB3.

**Unicenter Job Management Manager Linear Display Window**

The Linear Display window displays a list of the jobs you selected from the Load Jobs dialog box. Each rectangle in the Linear Display window shows the number, name, and owner of a selected job.

By default, all jobs are sorted by job number in the Linear Jobs Display window. Refer to Sorting Jobs in the Linear Display Window for more information on how to sort jobs in the Linear Display window.
The Linear Display window also lets you display a Navigation window that allows you to select and display portions of the window that are not visible, and to change the size of boxes displayed (see Using Navigation Windows).

The menu bar in this window includes the same five pull-down menus as the Graphical Display window, with the following differences:

- The File menu does not include Print...
- The Edit menu includes the following additional items:
  - Sort by Job number
  - Sort by Job name
  - Sort by Job owner

Pressing and holding MB3 on a job box in the Linear Display window displays a pop-up menu with the same choices found on the Jobs pull-down menu. Moving the pointer over Control and dragging the mouse to the symbol [-> displays a submenu with the same choices found on the Control pull-down menu. To choose one of these submenu items, move the pointer over the menu item you want and release MB3.
Unicenter Job Management Manager Real Time Message Display Window

The Real Time Messages Display window displays all Unicenter Job Management Manager job events on the system as they occur during your Unicenter Job Management Manager session. This window maintains up to 100 lines of messages; you can use the scroll bar to see messages that have scrolled off the top of the window. Messages from previous sessions are stored in a log file with a default name of NSCHED$::VERMONT_CREAMERY.LOG. You need SYSPRV privilege to view this log file.

Some messages are highlighted, while others are displayed in normal print.

<table>
<thead>
<tr>
<th>These messages</th>
<th>Provide information about ...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Highlighted</td>
<td>Your jobs that have currently completed, all jobs that were modified, all jobs with control action that were requested</td>
</tr>
<tr>
<td>Normal</td>
<td>All other messages</td>
</tr>
</tbody>
</table>

On a color display, different types of messages may appear in different colors, as determined by the file SCHEDULER$MOTIF.DAT in the DECW$SYSTEM_DEFAULTS directory or the user’s DECW$USER_DEFAULTS directory.
Interpreting Your Job Display

All job boxes in the Graphical Display window contain status symbols. Job boxes may be drawn with a solid or broken line or shaded gray. Some job boxes are connected by arrows, indicating job dependencies. The following sections provide information on interpreting symbols and arrows in the Graphical Display window.

Symbols in Job Boxes

Each job box in the Graphical Display window contains two symbols. The symbol in the upper-left corner indicates the last completed status of that job. The symbol in the bottom-right corner indicates the current state of that job.

For example, the hand symbols in the following job box indicate that the job ran successfully last time, and is currently on hold.

The following table describes the symbols displayed in job boxes.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Job State</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>⚠️</td>
<td>Failure</td>
<td>The last time the job ran, it failed.</td>
</tr>
<tr>
<td>🆙</td>
<td>Success</td>
<td>The last time the job ran, it completed successfully.</td>
</tr>
<tr>
<td>🙄</td>
<td>Unknown</td>
<td>The job has never run, so the last completion status is unknown (0).</td>
</tr>
<tr>
<td>⏰</td>
<td>Scheduled</td>
<td>The job is scheduled to run.</td>
</tr>
<tr>
<td>⏰</td>
<td>Job Slot Wait</td>
<td>The manager is running the maximum number of jobs on all nodes; the job is waiting for execution. One or more other jobs need to finish before this job runs.</td>
</tr>
<tr>
<td>🧲</td>
<td>Dependency Wait</td>
<td>The job is waiting for a job dependency to be satisfied before it can run.</td>
</tr>
</tbody>
</table>
Symbol | Job State | Definition
---|---|---
![Hold](image) | Hold | The job is on hold.

![Running](image) | Running | The job is currently running.

![Queued](image) | Queued | The job is scheduled to run in a BATCH queue, and is waiting for execution.

**Note:** When the job status of an unselected job on a remote node changes, the symbols in the job box are not updated.

### Selected and Unselected Job Boxes

When you select jobs to display in the Load Jobs dialog box, the manager also displays any jobs that are connected to the selected jobs by dependencies. These dependency-related jobs can be on the current node or a remote node. The manager displays the job boxes for selected and unselected jobs differently, as described in the following table. The owner of an unselected job is always displayed.

**Note:** In this context, unselected jobs are jobs that were not selected for display in the Load Jobs dialog box, rather than jobs that were not selected (highlighted) using MB1.

<table>
<thead>
<tr>
<th>When a job box is displayed like this ...</th>
<th>The job is ...</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Selected" /></td>
<td><strong>Selected</strong></td>
</tr>
<tr>
<td><img src="image" alt="Unselected" /> On the current node</td>
<td><strong>Unselected</strong></td>
</tr>
<tr>
<td><img src="image" alt="Unselected" /> Connected to one or more selected jobs by a dependency</td>
<td><strong>Unselected</strong></td>
</tr>
<tr>
<td><img src="image" alt="Unselected" /> On a remote node</td>
<td><strong>Unselected</strong></td>
</tr>
<tr>
<td><img src="image" alt="Unselected" /> Connected to one or more selected jobs by a dependency</td>
<td><strong>Unselected</strong></td>
</tr>
</tbody>
</table>
Note: You cannot perform actions on unselected jobs, nor can you create dependencies that involve them.

The following figure shows an example of selected and unselected job boxes as shown in the Graphical Display window:

In the example shown in the figure, a group of jobs was selected. This group contains two jobs:
- ERROR_LOG is dependent on two jobs on the current node.
- REMOTE_DEP is dependent on one job on a remote node.

Job Dependency Arrows

Jobs without dependencies are displayed at the top of the Graphical Jobs Display window, and jobs with dependencies are displayed below. Arrows indicate job dependencies. Each arrow indicates the order in which the connected jobs run; the arrow points to the job that depends on the other job.

Note: The manager displays dependent jobs using arrows that point from left to right, in the direction of the flow of execution of the jobs. (Arrows do not always point from left to right in the case of cyclic dependencies.) When you create a dependency that goes from right to left, the manager rearranges the job boxes in the window the next time it displays them, for instance, when you click on Refresh.
Loading Jobs to Display

When you start the Motif interface to the manager, you must load the jobs you want to work with. After you select them and click on OK, the jobs are displayed in the Graphical Display window and the Linear Display window.

You can select your own jobs and also jobs that belong to other users. You must have READ access to select a job; you must have also have WRITE access to a job to modify it. For more information on READ and WRITE privileges, see Privileges Needed to Use Unicenter Job Management Manager in the chapter “An Overview of Unicenter Job Management Manager.”

The following figure shows the Load Jobs dialog box; the table following the figure describes the fields in this dialog box.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job Name</td>
<td>The name of a job. Example: JOB_DAILY</td>
</tr>
<tr>
<td>Group Name</td>
<td>The name of a group of jobs. Example: DAILY_BACKUPS</td>
</tr>
<tr>
<td>Job Type</td>
<td>The name of a type of job. Example: FRIDAYS</td>
</tr>
</tbody>
</table>
To select the jobs you want to display:

1. Is the Load Jobs dialog box displayed?
   - If Yes, go to step 2.
   - If No, click on the Load Jobs... button in the Linear or Graphical Jobs Display window.

   The Load Jobs dialog box is displayed.

2. Click on one or more of the fields in this dialog box and enter the information for your job. You can use wildcards (*) in any of the fields. Characters appear in the field as you type.

3. When you are finished entering the information, click on **OK** or press Return.

   The Load Jobs dialog box is removed, and the jobs that match the criteria you specified are displayed in Display windows.

### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| User Name | The name of the owner of the jobs. Example: JONES  
Your user name is automatically entered in this field when you first access the manager, but you can change the user name to match that of the jobs you want to display. |
| Node Name | The name of a node within a cluster on which the jobs are restricted to run. Use this field when you want to display jobs that are restricted to running on a specific node. |
Clearing and Changing the Currently Displayed Jobs

If you want to clear the displayed jobs and display new jobs, you must first clear the Display windows and then select new jobs to display, as follows:

1. Click on the **Clear** button in the Graphical Display window or Linear Display window.
   
   **Note:** If you do not click on the **Clear** button, any new jobs that you select are added to the jobs currently displayed.

   All jobs are removed from both Display windows.

2. Click on the **Load Jobs...** button in either window.

   The Load Jobs dialog box is displayed.

3. Click on one or more fields in the dialog box and edit information for new jobs. You can clear all fields in the dialog box by clicking on **Reset**.

4. Click on **OK**.

   The new jobs that match the criteria you specified are displayed in both Display windows.

Adding to the Currently Displayed Jobs

To add more jobs to those currently displayed, follow these steps:

1. Click on the **Load Jobs...** button in either Jobs Display window.

   The Load Jobs dialog box is displayed.

2. Click on one or more fields in the dialog box and edit information for new jobs. You can clear all fields in the dialog box by clicking on **Reset**. See the table in Loading Jobs to Display for a description of the fields.

3. Click on **OK**.

   The new jobs that match the criteria you specified are added to both Display windows; you may need to use scroll bars to locate the new jobs.
Locating Jobs by Scrolling

If you have selected many jobs in your Unicenter Job Management Manager database, you may not be able to view all of your jobs at one time in the Display window. To use a menu item to perform an action on a job, you must first locate it in the Display window and then select it by clicking on it with MB1.

In the Graphical Display window you can use the scroll bars to find the job and then click on it with MB1. In the Linear Display window, you can sort jobs by number, job name, or job owner using the Edit menu; this makes finding the job easier.

When you select a job by clicking on it, it is highlighted in both Display windows, as shown in the following figure. When you click on a job in the Linear Display window, the Graphical Display window scrolls automatically to show the job, if necessary. The following figure shows both Display windows, with the job LIST_SAVESET selected:
Viewing Job Information

The Motif interface lets you view three types of information about a job:

<table>
<thead>
<tr>
<th>Information Type</th>
<th>Jobs Menu Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attributes</td>
<td>Edit...</td>
<td>Displays the attributes of a job.</td>
</tr>
<tr>
<td>Output file</td>
<td>Display Output...</td>
<td>Displays the output of a job.</td>
</tr>
<tr>
<td>Resource usage</td>
<td>Monitor...</td>
<td>Displays and updates the resource usage of a job while the job is running.</td>
</tr>
</tbody>
</table>

Viewing a Job’s Attributes

To view the attributes of a job, select it using MB1 and choose Edit... from the Jobs menu, or choose Edit... from the job’s pop-up menu. In the Graphical Jobs Display window, you can also Double-click on the job using MB1. The manager displays the job in the Job Edit dialog box. You can also edit the job from this dialog box (see Editing a Job).

More information about a job is available by clicking on the buttons at the bottom of the Job Edit dialog box: Auxiliary Options..., View Deps..., and Day Class Restrictions...

Viewing the attributes of a job is similar to using the following command in the DCL interface:

```bash
$ SCHEDULE SHOW JOB job_name/FULL
```

**Note:** To avoid changing a job’s attributes, be sure to click on the Cancel button in the Job Edit dialog box and its associated additional dialog boxes; do not click on OK or Apply.
The following figure shows the primary Job Edit dialog box:

---

### Viewing Job Output Files

A job output file captures the output of a job. An output file is not created unless a file name has been entered in the Output File field of the job’s Job Edit dialog box. When you view the output file for a job, the manager creates a window to display the output log file. You can shrink this window to an icon.

To view the output file for a job, select the job and choose Display Output... from the Jobs menu. When you are finished viewing the information, click on the Dismiss button to remove the window.

### Viewing Job Resource Usage

The Job Monitor window lets you monitor a job’s resource usage based on its historical minimum, average, and maximum usage. To display the Job Monitor window, select a job and choose Monitor... from the Jobs menu. You can shrink this window to an icon. The following figure shows the Job Monitor window:
The top half of the Job Monitor window lists job information such as the job name and number, user name, success count, and status. On the bottom-left are histograms that graphically display the resource usage of the job. For each job running in the Display window, you can monitor the current resource usage of the following:

- Elapsed time
- CPU time
- Page faults
- Buffered I/O count
- Direct I/O count

On the bottom-right of the window are the actual numbers associated with the histograms.

The rectangle outlines next to each resource indicate the historical usage. The left side of each rectangle represents the minimum usage, the right side represents the maximum usage. When information is within a narrow range, a thin or thick line is displayed instead of a rectangle.

The right sides of the rectangles are positioned relative to the maximum usage of each resource. Therefore, when a job is not running, all rectangles will be even on the right side.

While the job is running, white or colored bars display next to each resource to indicate the current usage; the rectangle outlines remain present to indicate the historical usage. While the job is running, the Job Monitor window automatically refreshes itself every 10 seconds to update the resource usage information.
When a Job Exceeds Historical Usage

When a job reaches the historical maximum usage for a resource, the white bar and the rectangle outline next to that resource are even on the right side. As the job begins to exceed the maximum usage for a resource, the rectangle outline next to that resource shifts to the left to show the current maximum usage.

The following figure shows a job that has exceeded the historical maximum usage for all resources:

Note how far the rectangles have shifted to the left. This distance allows you to compare the current usage (indicated by the white or colored bar), with the historical maximum usage (indicated by the rectangle outline).
Creating a Job

Use the Job Create dialog box to create a job. This dialog box contains text entry fields for entering job attributes and buttons for displaying three additional related dialog boxes. The three buttons at the bottom of the dialog box are grayed out until you create the job by clicking on the Apply button.

The following figure shows the primary Job Create dialog box, which is similar to the Job Edit dialog box:

To create a job in the Unicenter Job Management Manager database:

1. Pull down the Jobs menu from the Graphical or Linear Display window and choose Create....
   The Job Create dialog box is displayed.

2. Click on fields described in the following table and enter the information necessary for your job. Note that you can enter information only in the fields described in the following table. The manager automatically fills in the remaining fields after the job runs for the first time.

3. When you have finished entering information, click on OK to add your new job to the Unicenter Job Management Manager database.
   A highlighted message reporting the job creation is displayed in the Real Time Message Display dialog box, and a small DECwindows message box also appears.

4. Click on OK in the small DECwindows message box.
   The Job Create dialog box is removed from the screen.
The following table describes the fields you can use to enter job attributes in the Job Create dialog box.

<table>
<thead>
<tr>
<th>Use this field...</th>
<th>To enter...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job Name</td>
<td>The name of your job.</td>
</tr>
<tr>
<td>User Name</td>
<td>Your OpenVMS user name.</td>
</tr>
<tr>
<td>Group</td>
<td>The name of the group that this job belongs to.</td>
</tr>
<tr>
<td>Type</td>
<td>The name of the job type that this job belongs to.</td>
</tr>
<tr>
<td>Comment</td>
<td>Any miscellaneous comments you want to add.</td>
</tr>
<tr>
<td>Command</td>
<td>The primary system-level command to perform when this job is run.</td>
</tr>
<tr>
<td>Pre-Function</td>
<td>A command to perform before the job’s primary command.</td>
</tr>
<tr>
<td>Post-Function</td>
<td>A command to perform after the job’s primary command.</td>
</tr>
<tr>
<td>Output File</td>
<td>The name of the file to receive the output of this job.</td>
</tr>
<tr>
<td>Schedule Interval</td>
<td>The Unicenter Job Management Manager delta time interval for running the job. Example: D 01:00 specifies to run the job daily at 1:00 A.M.</td>
</tr>
<tr>
<td>Stall Time Job #</td>
<td>A local job to execute if the job’s stall time is exceeded. Note that you must use Unicenter Job Management Manager delta time in this field (+DDDD HH:MM:SS.)</td>
</tr>
<tr>
<td>Max Time Job #</td>
<td>A local job to execute if the job’s maximum time is exceeded. Note that you must use Unicenter Job Management Manager delta time in this field (+DDDD HH:mm:ss).</td>
</tr>
<tr>
<td>Read Identifier</td>
<td>A Privilege identifier that overrides the normal UIC protection.</td>
</tr>
<tr>
<td>Write Identifier</td>
<td>A Privilege identifier that overrides the normal UIC protection.</td>
</tr>
<tr>
<td>Execute Identifier</td>
<td>A Privilege identifier that overrides the normal UIC protection.</td>
</tr>
<tr>
<td>Next Run Time</td>
<td>When to run the new job for the first time (default: Never).</td>
</tr>
<tr>
<td>Maximum Run Time</td>
<td>The maximum Unicenter Job Management Manager delta time for the job to run before the Max Time Job is started (default: None). Use the</td>
</tr>
<tr>
<td>Use this field...</td>
<td>To enter...</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>format +DDDD HH:MM:SS. You cannot use this field if you do not specify a Max Time Job.</td>
</tr>
</tbody>
</table>

Stall Time

The maximum Unicenter Job Management Manager delta time for the job to stall before the Stall Time Job is started (default: None). Use the format +DDDD HH:MM:SS. You cannot use this field if you do not specify a Stall Time Job.

Mail Address

The address to which to send Mail (default: your username).

After you have filled in the fields necessary to create your job, you can click on Apply to create the job and then click on Auxiliary Options... and/or Day Class Restrictions... if you need to use these dialog boxes to enter more information.
Creating a Job Dependency

When you create a dependency, the direction in which you drag the mouse determines the dependency between two jobs: you press MB1 on the job that must complete before the job that depends upon it, drag, and release MB1 on the box that contains the dependent job. In example 1, the mouse was dragged from TEST1 to TEST2. In example 2, the mouse was dragged from TEST2 to TEST1. The arrow points in the direction of the dependent job.

**Note:** The manager displays dependent jobs using arrows that point from left to right, in the direction of the flow of execution of the jobs. When you create a dependency that goes from right to left, the manager rearranges the job boxes in the window the next time it displays them, for instance, when you click on Refresh.

**Example 1**

![Example 1 Image]

**Example 2**

![Example 2 Image]

To create a dependency for a job:

1. Locate the job you want to run first in the Linear Display window.
2. Select the job by clicking MB1 on it.
   
   The job is highlighted in the Graphical Display window and the Linear Display window.
3. In the Graphical Display window, move the pointer over the job that you want to run first. Press and hold MB1.
4. Is the second job visible in the Graphical Display window?
   
   If **Yes**, drag the mouse to the second job and release MB1.
   
   As you drag the mouse, you create a line that follows the pointer from the first job to the second job. When you release MB1, an arrowhead appears on the line, pointing from the first job to the second job. Messages appear in the Real Time Messages Display window reporting that the second job was modified, and by whom.
Deleting a Job Dependency

To delete a job dependency, press and hold MB3 over the arrow that indicates the dependency and choose Remove Dependency from the pop-up menu. Messages appear in the Real Time Message Display window reporting that a dependency was deleted, and by whom.

To cancel this operation while in progress, move the pointer outside the pop-up menu and release MB3.

Controlling a Job: Aborting, Holding, Running, and Releasing

To abort, hold, run, or release a job:

1. Select the job by clicking MB1 on it.
   The job is highlighted in both Display windows.
2. Pull down the Control menu in either Jobs Display window and choose the action you want.
   The current state symbol in the lower-right corner of the job box changes to reflect the current state of that job.
   For example, if you choose Hold, the current state symbol changes to an open hand. See the table in Symbols in Job Boxes for a list of the job status symbols.
   Messages appear in the Real Time Messages Display window reporting the action you have taken.
Editing a Job

Use the Job Edit dialog box to edit jobs; this dialog box contains text entry fields for entering job information, and buttons for displaying three additional related dialog boxes. This dialog box is similar to the Create Job dialog box.

To edit a job, select the job and choose Edit... from the Jobs menu. In the Graphical Display window, you can also Double-click on a job to edit it. The following figure shows the primary Job Edit dialog box:

This dialog box contains text entry fields for entering job attributes and buttons for displaying three additional related dialog boxes.

To edit a job in the Unicenter Job Management Manager database:

1. Pull down the Jobs menu from the Graphical or Linear Display window and choose Edit...
   The primary Job Edit dialog box is displayed.
2. Click on the field you want to edit and enter new information for the job (repeat as required). To edit Auxiliary Options or Special Day Restrictions, click on the corresponding button to bring up an additional dialog box.
3. When you have finished editing information in a dialog box, click on OK. (If you want to save changes in the primary dialog box and go on to other associated dialog boxes, click on Apply.
   A highlighted message reporting the job modification is displayed in the Real Time Message Display dialog box, and a small DECwindows message box also appears.
4. Click on OK in the small DECwindows message box.
The associated dialog box is removed from the screen.

Refer to the table in Creating a Job for a description of fields in the primary Job Create dialog box.

The following figure shows the Auxiliary Options dialog box:

![Auxiliary Options dialog box](image)

For information about Special Day Restrictions, see the section Setting or Editing Day Class Restrictions.

For information about Load Balance Groups, see the section Setting or Editing Load Balance Groups for Jobs.

**Deleting a Job**

To delete a job from the Unicenter Job Management Manager database, select the job using MB1 and choose Delete from the Jobs menu. After deleting a job you can click on Refresh to reposition job boxes in the Graphical Display window.
Sorting Jobs in the Linear Display Window

By default, the manager sorts jobs by job number in the Linear Display window. You can also sort by job name or job owner, as well as resort by job number. Note that only the jobs in the Jobs window are sorted.

To sort the jobs in the Linear Display window, choose the type of sorting you want from the Edit menu.
Creating a Graphics File of Your Display

You can save all or part of the current Graphical Display window as a graphics file. When you choose Print... from the File menu in the Graphical Display window, the Print Dependency Display dialog box appears.

Click on one of the two option buttons to choose the entire diagram or the displayed portion only. Enter a title and a filename, and then click on OK. (The title will appear at the top of the printed file.)

The manager creates a .DDIF file and places this file in your top-level directory if you do not specify a directory. You can convert the .DDIF file into another format for printing, such as PostScript or sixel graphics, using the DCL command CONVERT:

```
$ CONVERT/DOCUMENT filename.DDIF/FORMAT=DDIF
 _To: filename.type/FORMAT=type
```

**Note:** Job status symbols do not appear in the job boxes in the .DDIF file.
Using Navigation Windows

A Navigation window is a small window that lets you view the overall contents of the larger window, including the areas not currently displayed. You can see the number of selected jobs not currently visible in the larger windows. Navigation windows do not display the text displayed in the larger windows. You cannot shrink Navigation windows to icons.

You can display a Navigation window for either the Graphical or Linear Display window by clicking on the box located in the corresponding window where the horizontal and vertical scroll bars meet. When you have finished using the Navigation window, click on this box again to remove the Navigation window from the screen.

The following sections describe how to use a Navigation window to:

- Select and display a new portion of the Graphical Display window or the Linear Display window
- Scale objects in the Graphical Display window

The next two figures show the Navigation windows for the Graphical Display window and the Linear Display window.
Linear Display Window and Its Navigation Window

Selecting and Displaying a New Portion of a Display Window

In a Navigation window, the contents of the main window are displayed within a rectangular outline in the Navigation window. To select and display a different area of the main window, click inside this outline and use MB1 to drag it to the new location inside the Navigation window. The main window scrolls to show the new area.

resizing a portion of the graphical display window

To scale objects in the Graphical Display window (for instance, to see more job boxes in a smaller area):

1. Move the pointer within the rectangle outlined in the Navigation window. Then press and hold MB3.
   The pointer changes to a + symbol when it is placed in the rectangle.
2. Drag MB3 slowly toward the edge of the rectangle to display a larger area with smaller job boxes, or drag MB3 toward the center of the rectangle to display a smaller area with larger job boxes.
   As you drag MB3, the size of the rectangle changes.
   The job boxes in the Graphical Display window are resized.
   Note that the Graphical Display window does not change size, but that the job boxes are resized. Also note that job status icons are not scaled.
4. Repeat steps 2 through 4 until the desired size is achieved.
Special Day Classes

In the Motif interface you can use the Day Classes menu in either Display window to perform the following Special Day functions:

- Create Special Day Classes
- Edit Special Day Classes
- Delete Special Day Classes

For general information about Special Day, see Special Days in the chapter “How Unicenter Job Management Manager Works.”

Use the Day Class Restrictions dialog box to set Day Class Restrictions for a job; you can access this dialog box from the primary Job Create or primary Job Edit dialog box by clicking on the Day Class Restrictions button.

Creating a Special Day Class

Creating Special Day Classes requires either OPER or SYSPRV privileges.

You can create a Special Day Class by choosing Create... from the Day Classes menu. This action displays the Special Days Calendar dialog box; you select the days that you want to make up the class by clicking on them in the calendar (this makes them become shaded). The shaded days on the calendar define the Special Day Class.

You can toggle the entire year, complete months, or individual days by clicking MB1 on them. You may toggle all monthly occurrences of a day by clicking on its symbol. For example, to select all Wednesdays in May, click on the W under May on the Calendar screen.
Select any year between 2000 and 2009 by clicking up or down on the scroll bar to the right of the calendar. You can scroll to the next decade by clicking MB1 on the stepping arrow beneath the scroll bar. You can scroll to the previous decade by clicking MB1 on the stepping arrow above the scroll bar. You can use the scroll bar and arrows to navigate through the years 1970-2037.

To create Special Day Classes with the Motif interface:

1. Choose Create from the Day Classes menu.
   The Unicenter Job Management Manager Calendar is displayed. It contains a 1-year calendar.

2. Click on the day or days that comprise the class. At any point you may choose Cancel or Clear.
   The selected days are shaded.

3. When you have finished defining the class, enter its name in the text field labeled Save as class name.

4. Click on OK to save the class data.
   The Special Days Class is created.

Editing a Special Day Class

To edit a Special Day Class with the Motif interface:

1. Choose Edit... from the Day Classes menu.

   A list box of existing Day Classes is displayed as shown in the following figure:
2. Double-click on the name of the class to edit.

   The **Special Days Calendar** is displayed.

3. Edit the class by toggling days, months, or years.

   The new Special Day Class is defined by the days that are shaded.

4. Click on **OK** to save changes to the class data.

   The Special Days Class is redefined.

5. A dialog box appears that asks you to confirm the changes.

   Click on **OK** to save the changes.

---

### Deleting a Special Day Class

To delete a Special Day Class with the Motif interface:

1. Choose **Delete...** from the **Day Classes** menu.

   A list box of existing Day Classes is displayed as shown in the following figure:

   ![Edit Special Day Class Figure]

   2. Double-click on the Special Day Class to delete.

      A dialog box appears that asks you to confirm the deletion.

   3. Click on **Yes** to confirm the deletion, or **No** to abort the deletion.

      The dialog box is cleared from the screen.
Setting or Editing Day Class Restrictions

Day Class Restrictions let you restrict a job so that it:

- Runs **only** on the days defined by one or more Special Days Classes
- Does **not** run on the days defined by one or more Special Days Classes

To enter or edit Day Class Restrictions for a job, follow these steps:

1. Double-click on the job in the Graphical Display window, or select the job in either Display window and choose **Edit**... from the **Jobs** menu.
   The primary Job Edit dialog box appears.
2. Click on the button labeled **Day Class Restrictions**... in the dialog box.
   A dialog box appears for entering Day Class Restrictions.
3. Double-click on available Special Day Classes in the left-hand list box to transfer them to the right-hand list box of classes by which the job will be restricted.
   The class names move to the right-hand list box.
   You can also remove Special Day Classes individually from the right-hand list box by Double-clicking on them there, or clear all restrictions by clicking on **Clear Restrictions**.
   The class names move to the left-hand list box.
4. After you have chosen all Special Day Classes you want to apply to the job, click on one of the two left-hand radio buttons to choose whether the job will **not run** on included days, or will **run only** on included days.
   The radio button is highlighted.
5. Click on one of the two right-hand radio buttons to choose whether the job will be skipped on a Special Day or placed on hold until operator intervention.
   The button is highlighted.
6. Click on **OK** to set the Day Class Restrictions.
   A DECwindows message box appears informing you that the job has been modified.
7. Click on **OK** in the DECwindows message box.
   The Day Class Restrictions dialog box is cleared from the screen.
8. If you want to notify a job owner by Mail when a Special Day Action occurs, click on **Auxiliary Options**... in the primary Job Edit dialog box, and then click on the appropriate radio button at the bottom of the Auxiliary Options dialog box.
   The button is highlighted.
9. Click on **OK** in the Auxiliary Options dialog box.
A DECwindows message box appears.

10. Click on **OK** in the DECwindows message box.
    
    The Auxiliary Options dialog box is cleared from the screen.

11. Click on **OK** in the primary Job Edit dialog box.
    
    The dialog box is cleared from the screen.

**Notes:**

- You cannot use the **Apply** button repeatedly to combine different restrictions, such as **running** for some Special Days Classes and **not running** for others.

- Setting or editing a job’s Day Class Restrictions **does not** affect its next scheduled run time. The restrictions apply to run times **following** the next scheduled run time.
Load Balance Groups

In the Motif interface, the Load Balance Group Editor... option in the Edit menu of either display window lets you perform the following Load Balance Group functions:

■ Create Load Balance Groups
■ Edit Load Balance Groups
■ Delete Load Balance Groups

For more information on Load Balance Groups, see the chapter “How Unicenter Job Management Manager Works.”

The Auxiliary Job Edit dialog box lets you assign a Load Balance Group to a job or remove an assignment. You access this dialog box from the primary Job Create or primary Job Edit dialog box by clicking the Auxiliary Options... button. You can also enter the Load Balance Group Editor while editing a job. From the Auxiliary Job Edit dialog box, click on the Groups Editor button.

The Load Balance Group Editor

You can create, edit, or delete a Load Balance Group in the Load Balance Group Editor. To access the Load Balance Group Editor, select Load Balance Groups Editor... from the Linear Display or Graphical Display Edit menu. The Load Balance Group Editor appears.
From the editor, you can select the nodes from your local cluster that you want to include as members of the Load Balance group. The dialog box includes a list of Load Balance Groups. For the currently selected Load Balance group, the editor displays a list of Unselected Nodes and a list of Selected Nodes. With the editor, you can also delete a group and specify a new group name.

Creating a Load Balance Group

To create Load Balance Groups, you must have either OPER or SYSPRV privileges.

To view the nodes that are members of a Load Balance group, click the group name in the Load Balance Groups list. You can move a node from the Unselected Nodes list to the Selected Nodes list by clicking on the node name and then clicking on the “>” button. The “>>” button lets you move all Unselected Nodes to the Selected Nodes list. The “<“ and “<<” buttons remove nodes from the Selected Nodes list.

To create Load Balance Groups with the Motif Interface, follow these steps:
1. Select Load Balance Groups Editor… from the Edit menu. You can also click the Groups Editor button from the Auxiliary Job Edit dialog box.
2. Enter the group name in the New Group field. Click Apply.
3. Select nodes from the Unselected Nodes list.
   The selected nodes appear in the Selected Nodes list.
4. When you have finished defining the Load Balance Group, click OK. The Load Balance Group is created.

Editing a Load Balance Group

To edit a Load Balance Group with the Motif interface, follow these steps:
1. Select Load Balance Groups Editor… from the Edit menu. You can also click the Groups Editor button from the Auxiliary Job Edit dialog box.
2. Click the Load Balance Group name that you want to edit.
3. As needed, move nodes between the Unselected Nodes list and the Selected nodes list.
   The selected nodes appear in the Selected Nodes list.
4. When you have finished editing the Load Balance Group, click OK. The changes to the Load Balance Group are saved.
Deleting a Load Balance Group

To delete a Load Balance Group with the Motif interface, follow these steps:

1. Select Load Balance Groups Editor... from the Edit menu. You can also click the Groups Editor button from the Auxiliary Job Edit dialog box.
2. Click the Load Balance Group name that you want to delete.
3. Click Delete Group. The Load Balance Group is deleted.

   **Note:** If the group is referenced in any job definitions, the reference is removed, leaving the job with no Load Balance Group assignment. For more information, see the chapter "Getting Started with Unicenter Job Management Manager."

4. Click OK. The changes to the Load Balance Group are saved.
Setting or Editing a Load Balance Group for a Job

To assign a Load Balance Group to a job or change the Load Balance Group assigned to a job with the Motif Interface, follow these steps:

1. Double click on the job’s icon in the Graphical or Linear Display. You can also select the job by clicking the job and then select Edit... from the jobs menu.

2. Click the Auxiliary Options... button. The Unicenter Job Management Job 10 Edit (Auxiliary) dialog appears.

3. Use the arrows to locate the Load Balance Group.

   **Note:** If you need to create a new group, you can click the Groups Editor button.

4. Click the name of the Load Balance Group you want to assign the job to. To remove a Load Balance Group assignment, select <None>.

5. Click Apply. Your selection is saved. You can also click OK to save your selection and exit the Unicenter Job Management Job 10 Edit (Auxiliary) dialog.
Exiting from the Motif Interface

To exit from the Motif interface, pull down the File menu from the Graphical Display window or Linear Display window and choose Quit. All Unicenter Job Management Manager windows are removed from the screen.
Appendix A: Unicenter Job Management Manager Components

Components

Unicenter Job Management Manager (the manager) consists of the following files and system components:

Files

For a list of Unicenter Job Management Manager files supplied in the installation kit, see the Unicenter Job Management for OpenVMS I64 r3 Installation Guide.

System Components

- Job executor (NSCHED.EXE), a detached process that executes jobs
- Job database, a collection of information that describes jobs on a node or cluster of nodes (VSS.DAT)
- DCL interface that includes both management commands and general commands (SCHEDULER$MANAGER.EXE)
- Motif interface, a workstation approach that provides a graphical interface for the manager (SCHEDULER$MOTIF.EXE)
- Special Days databases (SCHED$SD_CLASSES.DAT and SCHED$SD_RESTRICTIONS.DAT)
- Event-log report utility for logging job events (VSS_REPORTS.EXE)
- Program (RETRY.EXE) gets executed by the manager on regular intervals when an action is being retried. It runs regularly until the actions it is attempting (stored in RETRY.DAT) are successful, or the retry period expires.
- Detached process (SCHED_REMOTE.EXE) that listens for remote Unicenter Job Management Manager actions, enabling the manager to work over a network. NODENAME_REMOTE.LOG is the output log file for SCHED_REMOTE.EXE.
- Detached process (SCHED$LISTENER.EXE) that listens for termination messages from the remote Executor
Components

- Database repair utility (DB_UTILITY.EXE)
- Load Balance Groups configuration utility (SCHEDULER$CONFIG.EXE) that creates, edits, and deletes Load Balance Group definitions in the Load Balance Group database (UJM$LOAD_BALANCE_GROUPS.DAT) for customized load balancing in an OpenVMS cluster.
- CPU system rating utility (CPU_UTILITY.EXE) that displays the current system rating used in load balancing calculations.
Appendix B: Logical Names, Global Symbols, and Event Logs

Overview

This appendix provides a list of Unicenter Job Management Manager (manager) logical names and run time global symbols. The appendix also describes how to write job events to a log file.

Unicenter Job Management Manager Logical Names

The following table lists and describes Unicenter Job Management Manager logical names. The logical names reside in the file:

SYS$STARTUP:UJM$MANAGER$STARTUP.COM

You can edit this file to modify the values of the logical names.

<table>
<thead>
<tr>
<th>Logical Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NSCHED$</td>
<td>Default set up at installation, based on response from user questions. Points to the directories that contain all of the manager's files.</td>
</tr>
<tr>
<td>NSCHED$BS_MAX_WAIT</td>
<td>Identifies the maximum seconds to wait for &quot;Batch start.&quot;</td>
</tr>
<tr>
<td>NSCHED$BS_RETRIES</td>
<td>Identifies the number of times to retry sending &quot;Batch start.&quot;</td>
</tr>
<tr>
<td>NSCHED$CHECK_RATIO</td>
<td>Returns the ratio of timer events to check procedure.</td>
</tr>
<tr>
<td>NSCHED$CLEAR_RESTART_PARAM</td>
<td>A job can have a restart parameter set while it is running, so if it fails during execution, the restart parameter can be passed back when it restarts. If this is defined as TRUE, this behavior is maintained. If defined as FALSE, the restart parameter will not be cleared when the job completes. <strong>Default:</strong> TRUE.</td>
</tr>
<tr>
<td>Logical Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>NSCHED$CUSTOM_LOAD_BALANCE</td>
<td>If defined to point to a command procedure to execute, the current (default) load balancing will be overridden. The command file will be executed at the time of considering a load balance. The manager expects that command procedure to have defined a logical called NODE_TO_USE as the nodename to use. <strong>Default:</strong> UNDEFINED.</td>
</tr>
<tr>
<td>NSCHED$DEBUG</td>
<td>Sets debug either on or off. <strong>Default:</strong> off.</td>
</tr>
<tr>
<td>NSCHED$DEFAULT_JOB_MAX</td>
<td>Defines the maximum number of jobs allowed to run at one time. <strong>Default:</strong> 6.</td>
</tr>
<tr>
<td>NSCHED$DEFAULT_JOB_PRI</td>
<td>Sets the priority level at which jobs will run. <strong>Default:</strong> level 4.</td>
</tr>
<tr>
<td>NSCHED$DEFAULT_LOG</td>
<td>Defines the logging events that will be captured. <strong>Default:</strong> JOB_EVENT and ABNORMAL_EVENT.</td>
</tr>
<tr>
<td>NSCHED$DEFAULT_SD_ACTION</td>
<td>Defines the system default Special Day Action, which can be SKIP or HOLD. <strong>Default:</strong> SKIP.</td>
</tr>
<tr>
<td>NSCHED$LBAL$CPU_WEIGHT</td>
<td>Weighs the CPU rating by multiplying the CPU rating by the translation of this logical. A valid range is from 0.0 to 1.0. <strong>Default:</strong> 0.5.</td>
</tr>
<tr>
<td>NSCHED$LBAL$INTERVAL</td>
<td>Determines the number of seconds between data collection. <strong>Default:</strong> 30.0 seconds.</td>
</tr>
<tr>
<td>NSCHED$LBAL$MEMORY_WEIGHT</td>
<td>Weighs the memory rating by multiplying the memory rating by the translation of this logical. A valid range is from 0.0 to 1.0. <strong>Default:</strong> 0.5.</td>
</tr>
<tr>
<td>NSCHED$LBAL$WAIT_AVAIL_NODE</td>
<td>If TRUE, puts a job in Job Slot Wait for an available node when a Load Balance Group has no available nodes. If FALSE or UNDEFINED, the job is run on the default Unicenter Job Management node. <strong>Default:</strong> UNDEFINED.</td>
</tr>
<tr>
<td>NSCHED$LOAD_BALANCE</td>
<td>Turns load balancing on or off. <strong>Default:</strong> on.</td>
</tr>
<tr>
<td>NSCHED$LOGFILE</td>
<td>Names the Unicenter Job Management Manager log file. <strong>Default:</strong> NSCHED$::VERMONT_CREAMERY.LOG.</td>
</tr>
<tr>
<td>NSCHED$MAILBOX</td>
<td>System logical that points to the manager’s message mailbox. <strong>Users should not touch this in any way.</strong></td>
</tr>
<tr>
<td>NSCHED$MESSAGE_RATIO</td>
<td>Returns the ratio of mailboxes messages to timer_event.</td>
</tr>
<tr>
<td>NSCHED$NODEPS</td>
<td>Suppresses the display of job dependencies. <strong>Default:</strong> TRUE.</td>
</tr>
<tr>
<td>NSCHED$node_SCHED_PORT</td>
<td>The variable <em>node</em> is the OpenVMS node name defined by SYS$NODE in DECnet. If you cannot use the default UDP port 5482 on this system, define this logical to override.</td>
</tr>
<tr>
<td>Logical Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>the default. <strong>Default:</strong> 5482.</td>
</tr>
<tr>
<td><strong>NSCHED$remnode_EXEC_PORT</strong></td>
<td>The variable <em>remnode</em> is the name of the target remote node. The node name can be, at most, 13 characters. Use this logical in the case of a remote node that must use a UDP port number other than the default (5481). It may require defining an alias for a remote node so its length is fewer than 14 characters. The variable <em>remnode</em> will be the same as the node specified in the job’s <code>REMOTE_NODE</code> characteristic. <strong>Default:</strong> 5481.</td>
</tr>
<tr>
<td><strong>NSCHED$REMOTE_SUPPORT_ENABLED</strong></td>
<td>The default is defined by the installation, where the installed will be asked questions. If TRUE, remote support will be available. Remote mode jobs and accompanying parameters are supported.</td>
</tr>
<tr>
<td><strong>NSCHED$SILENT</strong></td>
<td>Suppresses the connecting messages to remote nodes. <strong>Default:</strong> true.</td>
</tr>
<tr>
<td><strong>NSCHED$TERM_MAILBOX</strong></td>
<td>System logical that points to the manager’s termination message mailbox. <strong>Users should not touch this in any way.</strong></td>
</tr>
<tr>
<td><strong>NSCHED$TERMINATION_RATION</strong></td>
<td>Returns the ratio of termination messages to mailboxes.</td>
</tr>
<tr>
<td><strong>NSCHED$UID</strong></td>
<td>Defines the location of the X-window interface user interface definition (UID) file.</td>
</tr>
<tr>
<td><strong>NODE_TO_USE</strong></td>
<td>Defined by users if they have selected custom load balancing. It is a local logical, so often it will not have wide impact.</td>
</tr>
<tr>
<td><strong>SCHED$BATCH_KEEP_LOG</strong></td>
<td>Retains log files from jobs run in batch queues. <strong>Default:</strong> TRUE.</td>
</tr>
<tr>
<td><strong>SCHED$BATCH_PRINT_LOG</strong></td>
<td>Prints log files from jobs run in batch queues. <strong>Default:</strong> FALSE.</td>
</tr>
<tr>
<td><strong>SYS$NODE</strong></td>
<td>Must be defined as the name of the node before the manager starts.</td>
</tr>
</tbody>
</table>
Run Time Global Symbols Available to Jobs

The following table shows the run time global symbols created by the manager each time it runs a job. You can reference these global symbols in your command procedures when a job needs information about itself.

For example, a job may want to read its comments (which can be specified in the RUN command), its job name within the command procedure, or its job number so that it can change its own operation.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH$RESTART</td>
<td>The restart value set by the last SCHEDULE SET RESTART command within the job’s command procedure if the system failed while the job was running.</td>
</tr>
<tr>
<td>NSCHED_COMMAND</td>
<td>The job’s main OpenVMS command, created or modified by the job’s owner. For example: @SYS$DEVICE:([DOE.PROJ-C]WKLY-COPY.COM</td>
</tr>
</tbody>
</table>
### Run Time Global Symbols Available to Jobs

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(if any). Refer to Prefunctions and Postfunctions in Chapter 2, “How Unicenter Job Management Manager Works,” for a discussion of prefunctions and postfunctions. For example, a hexadecimal string.</td>
</tr>
<tr>
<td>NSCHED_STEP</td>
<td>Symbol defined for a job when it is run (similar to NSCHED_COMMAND or NSCHED_JOBNAME). It has one of the five following values, indicating the current step of job execution from the manager perspective: NSCHED_PRE_START, NSCHED_PRE_RUN, NSCHED_MAIN_START, NSCHED_MAIN_RUN, NSCHED_POST_RUN</td>
</tr>
<tr>
<td>NSCHED_TYPENAME</td>
<td>The job’s type, created or modified by the job's owner. For example: PROGRAM, DOCUMENTATION, BACKUP, PROJECT-COSTS</td>
</tr>
<tr>
<td>NSCHED_VERSION</td>
<td>Symbol defined for a job when it is run (similar to NSCHED_COMMAND or NSCHED_JOBNAME). It is an 8-character string that indicates the version number of the manager.</td>
</tr>
<tr>
<td>$VSSRESTART</td>
<td>The job’s current restart flag, set by the manager. This flag’s setting is TRUE only if the job is set for RESTART. Otherwise, the setting is FALSE. Refer to the /RESTART qualifier for the SCHEDULE CREATE command for more details about job restarts.</td>
</tr>
</tbody>
</table>
Writing Job Events to a Log File

Unicenter Job Management Manager can write a job event-log file that records when a job starts, completes, or encounters an error. The file also records when other significant system activities occur.

If you have privileges to use the manager’s management commands, you can use logging commands to perform the following functions with this event-log file:

- Control the types of information logged with the SCHEDULE SET LOGGING command.
- Close and rename the event-log file with the SCHEDULE CLOSE LOG_FILE command.
- Display the Unicenter Job Management Manager event-log reports with the SCHEDULE SHOW LOGGING command.

The name of the event-log file is controlled by the logical name NSCHED$LOGFILE. The system manager should define this logical name in the SYS$STARTUP:SCHEDULER$STARTUP.COM file. If you do not define this logical name, the default name is NSCHED$:VERMONT_CREAMERY.LOG.

See the individual command descriptions for more details on how to use these event-log features and logging command.
Appendix C: Customizing Load Balancing

Overview

This appendix provides information on customizing your own load balancing algorithm.

Customizing Load Balancing

To use fully customize load balancing, you need to define the logical NSCHED$CUSTOM_LOAD_BALANCE to the value TRUE. Then Unicenter Job Management Manager (the manager) spawns the command procedure NSCHED$COM:LOAD_BALANCE.COM each time a job is to be run. The job runs on the node pointed to by the logical NODE_TO_USE that is defined in the load balance command procedure.

The manager provides two load-balance command procedures:

- The default algorithm is implemented in the LOAD_BALANCE.COM file. This algorithm relies on a program that calculates the relative load rating of each node in an OpenVMS cluster, based on memory and CPU ratings.

- An alternative algorithm is implemented in the file LBAL_ROUND_ROBIN.COM. This algorithm uses simple round-robin load balancing.

You can set the NSCHED$CUSTOM_LOAD_BALANCE logical in the manager’s startup procedure to TRUE or FALSE. If TRUE, it spawns the file NSCHED$:LOAD_BALANCE.COM to perform the load balancing algorithm. The existence of this file is the responsibility of the system managers.

SCHEDULER$LBAL and SCHEDULER$LBAL_MGMT, present in Unicenter Job Management Manager V2.0 and earlier, have been removed from the product. SCHED SHOW LOAD_BALANCE [/NODE=node, /ALL] shows full rating information. SCHED SHOW STATUS now contains the rating in place of the LBAL string. When load balancing is enabled, the “sched_flags” field in the return buffer from VSS$SHOW_SCHED returns the actual rating as a numeric string rather than LBAL.
VSS$GET_BEST_NODE (new function) returns the name of the node to select for load balancing.

VSS$GET_LBAL_INFO (new function) is called with a nodename and returns load rating components into a 16-byte buffer passed by reference.

The file LOAD_BALANCE.COM supports the ability to restrict a job or a group of jobs to run on a list of nodes, instead of to a single node.

The SCHED$GET_BEST_NODE.EXE program defines the logical NODE_TO_USE to be the best rated node in the cluster. It is possible to pass this program a parameter that is a list of nodes, separated by spaces, from which the program will choose the best-rated node.

Two system logicals can be defined to achieve this behavior:

```
DEFINE/SYSTEM SCHED$LBAL_GROUP_groupname "node1 node2 node3"
```

This allows the jobs with the given group name to be load balanced on one of the three listed nodes.

```
DEFINE/SYSTEM SCHED$LBAL_JOBNUM_jobnumber "node2"
```

This overrides the job group restriction above and further restricts the given job to the given node.

If " " is given as the node parameter list, all available nodes in the cluster will be used.

**Note:** If the LOAD_BALANCE.COM procedure cannot identify a node on which to run the job (specified Unicenter Job Management Manager does not exist), the job it is attempting to run is put in HOLD state and you are notified as appropriate by mail, OPCOM, and terminal notify.
Restricting a Job to Run on a Specific Node

To restrict a job to run on a specific node when you use fully customized load balancing, follow these steps:

1. Define the logical name NSCHED$CUSTOM_LOAD_BALANCE as TRUE:
   
   `$DEFINE/SYSTEM/EXEC NSCHED$CUSTOM_LOAD_BALANCE "TRUE"`

2. Define the logical name SCHED$LBAL_JOBNUM_## to point to the node where you want the job to run:
   
   `$DEFINE/SYSTEM/EXEC SCHED$LBAL_JOBNUM_3 "nodename"`
Appendix D: Troubleshooting and FAQs

This appendix provides some troubleshooting tips for Unicenter Job Management Manager (the manager) and Unicenter Job Management Agent (the agent) as well as some answers to frequently asked questions.

Troubleshooting the Manager

The following tables provide tips for diagnosing and fixing some common Unicenter Job Management Manager issues:

Next Run Time Is NEVER

<table>
<thead>
<tr>
<th>Possible Causes</th>
<th>Possible Solutions</th>
</tr>
</thead>
<tbody>
<tr>
<td>No days specified</td>
<td>Modify job to have some days specified</td>
</tr>
<tr>
<td>No interval specified</td>
<td>Modify job to have an interval, and run the job</td>
</tr>
<tr>
<td>No start time specified for new job</td>
<td>Modify job to have a next start time</td>
</tr>
<tr>
<td>Job was modified /NEXT=NEVER</td>
<td>Modify job to have a next start time</td>
</tr>
<tr>
<td>Job was restricted to a Special Day Class with no days in the future</td>
<td>Modify next start time or Special Day Class</td>
</tr>
</tbody>
</table>

Next Run Time Is Wrong

<table>
<thead>
<tr>
<th>Possible Causes</th>
<th>Possible Solutions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Encountered Special Day Restrictions</td>
<td>Relax or change job’s Special Day Restrictions, or modify Special Day Class</td>
</tr>
<tr>
<td>Fiscal calendar not as expected</td>
<td>See documentation for SCHEDULE SHOW FISCAL_YEAR and SCHEDULE SET FISCAL_YEAR for fiscal year characteristics</td>
</tr>
<tr>
<td>USE_NEXT_TIME in effect</td>
<td>Verify that /USE_NEXT_TIME is appropriate for the job</td>
</tr>
</tbody>
</table>
### Troubleshooting the Manager

#### Possible Causes

<table>
<thead>
<tr>
<th>Possible Causes</th>
<th>Possible Solutions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job was modified by someone</td>
<td>N/A</td>
</tr>
<tr>
<td>Job already ran, or did not run when expected</td>
<td>N/A</td>
</tr>
</tbody>
</table>

#### Job Did Not Run or Did Not Run at Specified Time

<table>
<thead>
<tr>
<th>Possible Causes</th>
<th>Possible Solutions</th>

The following conditions determine the run time for a job:

- Jobs run when the specified scheduler is accessible AND
- scheduled time is in the past
- all dependencies have been met
- there are available job slots
OR
    ■ there is a manual request to run the job and
    ■ there are available job slots

OR
    ■ the job is an SJOB or TJOB and
    ■ the related job is stalled or timed out and
    ■ there are available job slots
Troubleshooting Unicenter Job Management Agent

The following sections provide tips for diagnosing and fixing some common Unicenter Job Management Agent issues.

Unicenter Job Management Manager Runs a Job on an Agent

When the manager tries to run a job on an agent, the following two types of errors can occur:

- Error occurs preventing the job from starting.
- Error occurs during the job run

When an error occurs that prevents the job from starting, the manager never sends a message that the job started. However, the manager sends a job completion message that includes one of the error codes listed in the section Agent Error Codes.

Missing Information in the .ERR File

When it runs, the agent produces an .ERR file; however, you may not find the information you need. To find the information, you must look at the agent’s output file: SYS$SYSTEM:NSCHED$AGENT.LOG.

To turn on debugging in the agent, follow these steps:

1. Open the following file:
   SYS$SYSTEM:NSCHED$AGENT_RUN.COM

2. Find the following code:
   
   ```
   $!AGENT_PORT := 0
   $!DEFAULT_DIRECTORY := 0
   $!DEBUG_LEVEL := 0
   $!RUN_DETACHED = 1
   $!
   $SCHED$AGENT   !'AGENT_PORT'
   'DEFAULT_DIRECTORY' 'DEBUG_LEVEL'
   'RUN_DETACHED'
   ```

3. Remove the exclamation points to uncomment the four parameters and the NSCHED$AGENT line. Your code should look like the following:

   ```
   $AGENT_PORT := 0
   $DEFAULT_DIRECTORY := 0
   $DEBUG_LEVEL := 0
   $RUN_DETACHED = 1
   $!
   $SCHED$AGENT   'AGENT_PORT'
   'DEFAULT_DIRECTORY' 'DEBUG_LEVEL'
   'RUN_DETACHED'
   ```
4. Set DEBUG_LEVEL to 5.
   
   **Note:** You must uncomment all parameters because the parameters are position-dependent.

5. Close the file.

**Proxy Validation Error When Connecting to a Remote Node**

If you can connect to a remote node, but a proxy validation error occurs, the name of the manager node may not be defined in the agent’s hosts database. When this is true, the agent cannot translate the Unicenter Job Management Manager IP address into a name.

To define the manager node in the agent node’s TCPIP database, use the following command:

```
TCPIP> SET HOST UJM_Manager_node_name
       /ADDRESS=UJM_Manager_node_ip_address
```

For a node running TCPware, you must edit TCPWARE:HOSTS.

For MultiNet, you must edit MULTINET:HOSTS.LOCAL.

**SYS$NODE Incorrectly Defined**

Agent errors can occur if the logical name SYS$NODE is incorrectly defined. Check SYS$NODE on the agent node to make sure the logical name:

- is defined.
- ends in two colons (::).
- does not start with an underscore (_).
- is the same as the IP nodename.

If the DECnet nodename and the IP nodename differ, edit SYS$SYSTEM:NSCHED$AGENT_RUN.COM to define sys$node as a process logical name with the IP nodename for its value.
## Agent Error Codes

The following table lists error codes you may receive when an agent runs:

<table>
<thead>
<tr>
<th>Symbol Name</th>

</table>
Frequently Asked Questions

This section provides answers to some of the most frequently asked questions about Unicenter Job Management Manager. The questions and answers are grouped by topic:

- General questions
- Setting up jobs
- Mail and broadcast messages
- If the manager stops
- Reports

General Unicenter Job Management Manager Questions

How can I see what version of Unicenter Job Management Manager I am running and other information about the manager?

Use the following command:

SCHEDULE> SHOW STATUS

My account UIC has been changed. How do I change or modify the UIC in the manager’s database?

1. From an account with the CMKRNL privilege (such as the SYSTEM account), enter a command similar to the following:

SCHEDULE> MODIFY *=SMITH/USERNAME=SYSTEM

This command line changes ownership of all jobs owned by username Smith to username SYSTEM. Carefully note the list of job numbers that are changed, because SYSTEM may already own a number of jobs. If SYSTEM already has a job with the same name as Smith, Smith will also have to change the job name because job names must be unique within an OpenVMS username. Using a GROUP name is a way of keeping the job separated from jobs that belong to the SYSTEM account.
2. Enter the following command to display job names and numbers, and be prompted if you want to change the username for each. Answer yes only if the job was originally your job. Those jobs will then have your new UIC.
```
SCHEDULE> MODIFY *=SYSTEM/USERNAME=SMITH/CONFIRM
```

I have a job that runs successfully in batch, but fails in the manager with the following error. What’s the problem?

RMS-E-DEV. Error in device name or inappropriate device type for operation

If you have specified an output file, check to ensure that the file specification is defined at the system level. Output file specifications cannot reference a file using logicals that were set up at the time of login. A logical used to specify an output file must be a system logical.

For example, an output file named SYS$LOGIN:my_job.LOG will fail because it is not defined at the time the process was created. An output file named SYS$MANAGER:my_job.LOG will work successfully because SYS$MANAGER is a system-wide logical.

Why does my stall job (SJOB) run more than once?

If a job is stalled (not started by the time it should have), the designated notification occurs. If the manager “looks” at that job (anytime a job is modified), the manager discovers that the job is stalled and sends the notification again, possibly running any SJOBs again.

Setting Up Jobs

How can I specify a job to run on all nodes in a cluster at the same time?

First, use the SCHEDULE CREATE command to create a new job to run on one node. Then use the SCHEDULE COPY command to create additional clones of that job for each CPU. If you specify a /GROUP qualifier when you create the job, you can copy the group and run all jobs in the group at the same time. For example:
```
SCHEDULE> CREATE /GROUP=group-name /CLUSTER_NODE=node1/PROMPT
    (You will be prompted for additional information)
SCHEDULE> COPY job-number /CLUSTER_NODE=node2
SCHEDULE> COPY job-number /CLUSTER_NODE=node3
SCHEDULE> COPY job-number /CLUSTER_NODE=node4
    ...
SCHEDULE> RUN /GROUP=multijob
SCHEDULE> SHOW JOB /GROUP=multijob
```
How do I set up a job to run every six hours, Monday through Friday?

Use the following command to create the job:

```
SCHEDULE> CREATE "vms-command"/INTERVAL="+0 6"/DAYS=(ALL,NOSAT,NOSUN)
```

If you are running in an OpenVMS Cluster, you can add the /CLUSTER qualifier to control on which OpenVMS Cluster node the command executes.

I have scheduled a job that requires mail notification. The job runs okay, but no mail is received. What is the problem?

Ensure that the ENQLM quota of the account that the manager runs on is at least 300.

How do I stop a continuous job?

Enter the following command:

```
SCHEDULE> MOD job-name/NEXT=NEVER/NOINT
```

or

```
SCHEDULE> HOLD job-name
```

What happens when daylight saving time ends? Will a job that runs at 23:00 run again when the time falls back an hour?

Setting the clock back an hour should not affect scheduled jobs that have an interval greater than or equal to HOURLY. The reason is that the manager calculates the next time a job will run as soon as the job is ready to run. Moving the clocks ahead an hour also has no effect on jobs, because a job will run if its scheduled time is earlier than the current time.

Examples

- A job is scheduled to run every night at 23:00. At 23:00 tonight, just before it starts running, the job sets its next time to run for 23:00 tomorrow night.

  Assume you set back the clock one hour at 23:00. This will not affect the job, because its scheduled time is 23:00 tomorrow night. It will not run twice in the same night.

- At 2:00 A.M. you set your clock ahead to 4:00 A.M. Jobs scheduled to run at 3:00 A.M. start running immediately, because 3:00 A.M. is earlier than 4:00 A.M.
I have a job that must run on Wednesday of the third week of the fiscal month, except when the fiscal month has five weeks. In that case, the job should run on the Wednesday of the fourth week. How do I specify this?

Use the following interval:

/INTERVAL="F M -D11 HH:MM"/DAYS=(WED,NONE)

This interval specifies the last day of the fiscal month minus 11 days, which is the second-to-last Wednesday of the fiscal month. When you need to specify this type of interval, use your fiscal calendar to calculate the number of days to specify.

I have a complex job that needs to restart if the system fails or if the job fails because of an error at the step last marked with SCHEDULE SET RESTART_VALUE STEP_NAME. How do I restart at this step if the job fails because of an error?

Start every job with the following line:

$ IF P1 .NES. "" THEN GOTO P1

When you need to restart, use the following command:

$ SCHEDULE RUN my_job/PARAM=step_01

Step_01 is the step where the job should restart.

What should I do when jobs do not start at their scheduled time?

Stop the manager. Turn on DEBUG on the manager and view the log. (DEBUG can be enabled in the manager startup procedure, or by the SCHEDULE SET DEBUG ON command.)

DEBUG creates a file named NSCHED$:\nodename.LOG. The log file contains useful information about what is happening with the manager. Also, use the SCHEDULE SHOW STATUS to view other useful information.
Mail and Broadcast Messages

How do I turn off the manager’s broadcast messages?

When you create or modify a job, use the /PROMPT qualifier and answer no to the Notify prompt. (The default answer is yes, notify on completion.)

Example:

```
VMS Command: @dua1:[example.notes]nightly_notes.com

Job Name [None]: extract_notes
Group [None]: notes_group
Type [None]: nightly
Stall Notify [None]:
Stall Time Job [None]:
Schedule Interval [None]: d 03:00
Days [ALL]: (all, nosat, nosun)
Special Day Restrictions [None]:
Start Time [15-APR-2006 03:00:00.00]:
Output file [None]: dua1:[example.notes]nightly_log
Mode (Detached, Batch, Remote [DETACHED] :)
Cluster Node [Default]:
Retain (Success, Error, None or All) [ALL]:
Restart (Yes, No [Yes]): N
Retry (Yes, No [No]): N
Notify (Yes, No [No]): N
Send_Mail (All, Error, Success or None) [NONE]: error
Send MAIL on Special Day Action (Yes, No [No]):
Use_next_time (Yes, No) [No]:
OPCOM (Yes, No) [No]:
Mail_Address [EXAMPLE]:
User_Name [EXAMPLE]:
Run Priority [Default]:
Pre Function [None]:
Post Function [None]:
Maximum Time Warning [None]:
Maximum Time Job [None]:
LBAL Group [None]:
Synchronization [None]:
Comment [None]: This job extracts nightly notes
%WSCHED-I-RQSTSUCSS, Job 1 - Created
```
You could also use /NONOTIFY with SCHEDULE CREATE or SCHEDULE MODIFY, as follows:

```
SCHEDULE> CREATE "@user$: [smith] foo.com" -
_SCHEDULE> /INTER="+0 00:30" -
_SCHEDULE> /GROUP=personal -
_SCHEDULE> /TYPE=daily -
_SCHEDULE> /NAME=myjob
```

```
%NSCHED-I-REQTSUCCESS. Job 2 - Created
```

**How do I send mail notification to a distribution list instead of a single user?**

Use the following command:

```
SCHEDULE> MODIFY job_name
_MAIL_ADDRESS="@device:[directory]filename.DIS"
```

The default location for files referenced in the manager (such as output files and files referenced in the OpenVMS command) is the owner's SYS$LOGIN. You must specify the exact device and directory if the file is not in SYS$LOGIN.

You must enclose the mail distribution list in quotation marks.

**Stopped Jobs**

**What happens if some jobs are running in the manager when the manager fails or is stopped?**

After the manager starts a job, the job is an independent process that continues to run even if you stop the manager with the SCHEDULE STOP command.

- If you restart the manager before the job completes, all is normal.
- If the job completes while the manager is stopped, the termination message with the accounting information is not written to the manager's mailbox, and the database is not updated. The job remains marked as running on the current node and process (PID).
- When the manager restarts, it reads through the database and verifies that all jobs marked as currently running are actually running. If the manager finds a job that is not running even though the database entry says it is, then the current time and date are filled in and the completion status is changed to:

```
NSCHED-F-ABORTED, Job was aborted
```

This is a failure status. Any mail or broadcast notification is sent at this point. If the SET RESTART command is enabled for that job, then the job runs again. Otherwise, the job is put on hold.
Whenever I stop and restart the manager, it creates a file named your-system-name_REMOTE.LOG. Is this normal?

Unicenter Job Management Manager commands that come from outside your cluster are run by the SCHED_REMOTE process. This process receives DECnet connects, validates proxy accounts, and writes information to NSCHED$:NODE_REMOTE.LOG to provide an audit trail of remote activity. When the SCHED_REMOTE process starts, an empty file is created.

You can edit the Unicenter Job Management Manager startup procedure not to start the SCHED_REMOTE process if all of the following are true:

- You do not want to use Unicenter Job Management Manager commands on remote nodes.
- The remote nodes do not need to communicate with you.
- You do not have any jobs on your cluster that depend on remote jobs.

**Reports**

What reports are available with the manager, and how do I invoke them?

The following reports are available:

- Future job runs (SCHEDULE SHOW SCHEDULED_RUNS command)
- Past job runs (SCHEDULE SHOW HISTORY command)
- Past activity in the manager (Run NSCHED$:VSS_REPORTS.EXE.)

How do I create a report that will show me what jobs are scheduled to run during the next eight hours?

Use the following command:

```
SCHEDULE>  SHOW SCHEDULED_RUNS/END=“+8”/FULL
```
Cluster Alias
A collective name representing all nodes in one cluster.

Day Specifiers
The day(s) of the week that Unicenter Job Management Manager runs the job.

Event Log
A file in which Unicenter Job Management Manager events are logged, such as jobs starting, completing, resources consumed, and interface requests. The event log may be set to capture up to 11 event classes for each individual node in an OpenVMS Cluster. A log reader program provided with the kit produces standard reports.

Failover
When a Unicenter Job Management Manager node crashes on an OpenVMS Cluster that has multiple nodes running Unicenter Job Management Manager, one of the other nodes always updates and cleans up any jobs that were running on the crashed node and restarts the jobs if necessary.

Group
A job category, such as daily, weekly, or monthly. Users can specify jobs by group, and Unicenter Job Management Manager can perform certain actions on the entire group at once.

Interval
See Schedule Interval.

Job
A job consists of several elements: an OpenVMS command to execute the job, information about how and when to run the job, and actions to take on job completion. The information includes interval, completion notification, output-file specification, and job dependencies. A job can also include a prefunction and postfunction.

Job Dependencies
Job(s) that must complete successfully before another job can run.

Unicenter Job Management Manager Delta Time
The time interval from the current date and time to a date and time in the future. The Unicenter Job Management Manager delta time format is: +dddd hh:mm:ss.cc.

Job Specifier
The way to reference a job through the DCL interface. A job specifier is referenced by either name or number.

Load Balance Group
A subset of nodes in an OpenVMS cluster for load balancing. A job with a Load Balance Group defined is restricted to run only on the nodes in the group and load balances among them.

Load Balancing
All jobs that are not restricted to run on one specific node in an OpenVMS Cluster normally run on the default node in the cluster. If load balancing is enabled, such unrestricted jobs can be assigned to run on other nodes in the OpenVMS Cluster. Each job is assigned to the least loaded node in the cluster or the least loaded node in the load balance group (if defined).
Management Commands
Commands that require at least OPER or SYSPRV privileges to use. The Unicenter Job Management Manager management commands perform the following tasks: stop the Unicenter Job Management Manager from running on the entire OpenVMS Cluster, on a specific node in the cluster, or on a specific remote node on the network; set and show certain Unicenter Job Management Manager features; delete pending job-dependency notification retries on remote nodes; and close, rename, display, or print event logs.

Next Scheduled Time
A Unicenter Job Management Manager job’s next scheduled run time.

OPCOM
Operator Communication Manager. A system process to control communication between a process and a system operator.

OpenVMS Delta Time
The time interval from the current date and time to a date and time in the future. OpenVMS delta time format is: dddd-hh:mm:ss.cc.

Postfunction
An OpenVMS command that is executed after a job’s main OpenVMS command. Each job may have its own postfunction. A postfunction runs even if the main command fails.

Prefunction
An OpenVMS command that is executed before a job’s main OpenVMS command. Each job may have its own prefunction. If the prefunction ends with an error, the main command does not run, and the entire job terminates with an error.

Proxy Account
An account, defined in the Network User Authorization File that allows a remote user to have access to the local node by mapping into a local account. The remote user assumes all privileges and rights of the local account. Unicenter Job Management Manager remote access is allowed through both default and specified proxies or through an explicit account and password specification.

Remote Node
Any node in the network that is not in the user’s local OpenVMS Cluster.

Remote Node Job
A job designated to run on a remote Unicenter Job Management Manager agent that is running on a remote machine.

Schedule Interval
The time period between a job’s start times. The time period can be daily, hourly, Unicenter Job Management Manager delta time, fiscal time, regular monthly calendar interval, and continuous run.

Special Days
Jobs in a Special Day Class have their run times restricted by the class. Such jobs can be set to run only on days in the class, or can be set not to run on such days and be skipped or rescheduled for the next available day. Only users with OPER or SYSPRV privileges can create, modify, or delete Special Day Classes.

Type
A job category, such as backup, fiscal, or documentation. Users can specify jobs by type, and the Unicenter Job Management Manager can perform actions on jobs by type.

Wildcard Characters
The asterisk (*) and percent (%) characters are wildcards. The asterisk (*) matches any number of characters. The percent (%) matches exactly one character.
